

SDN/OpenFlow: Visão do CPqD

*TRANSFORMANDO
EM REALIDADE*

Workshop Datacom de SDN/OpenFlow
Curitiba, PR, 21-22 de Agosto de 2013

Como enxergamos SDN

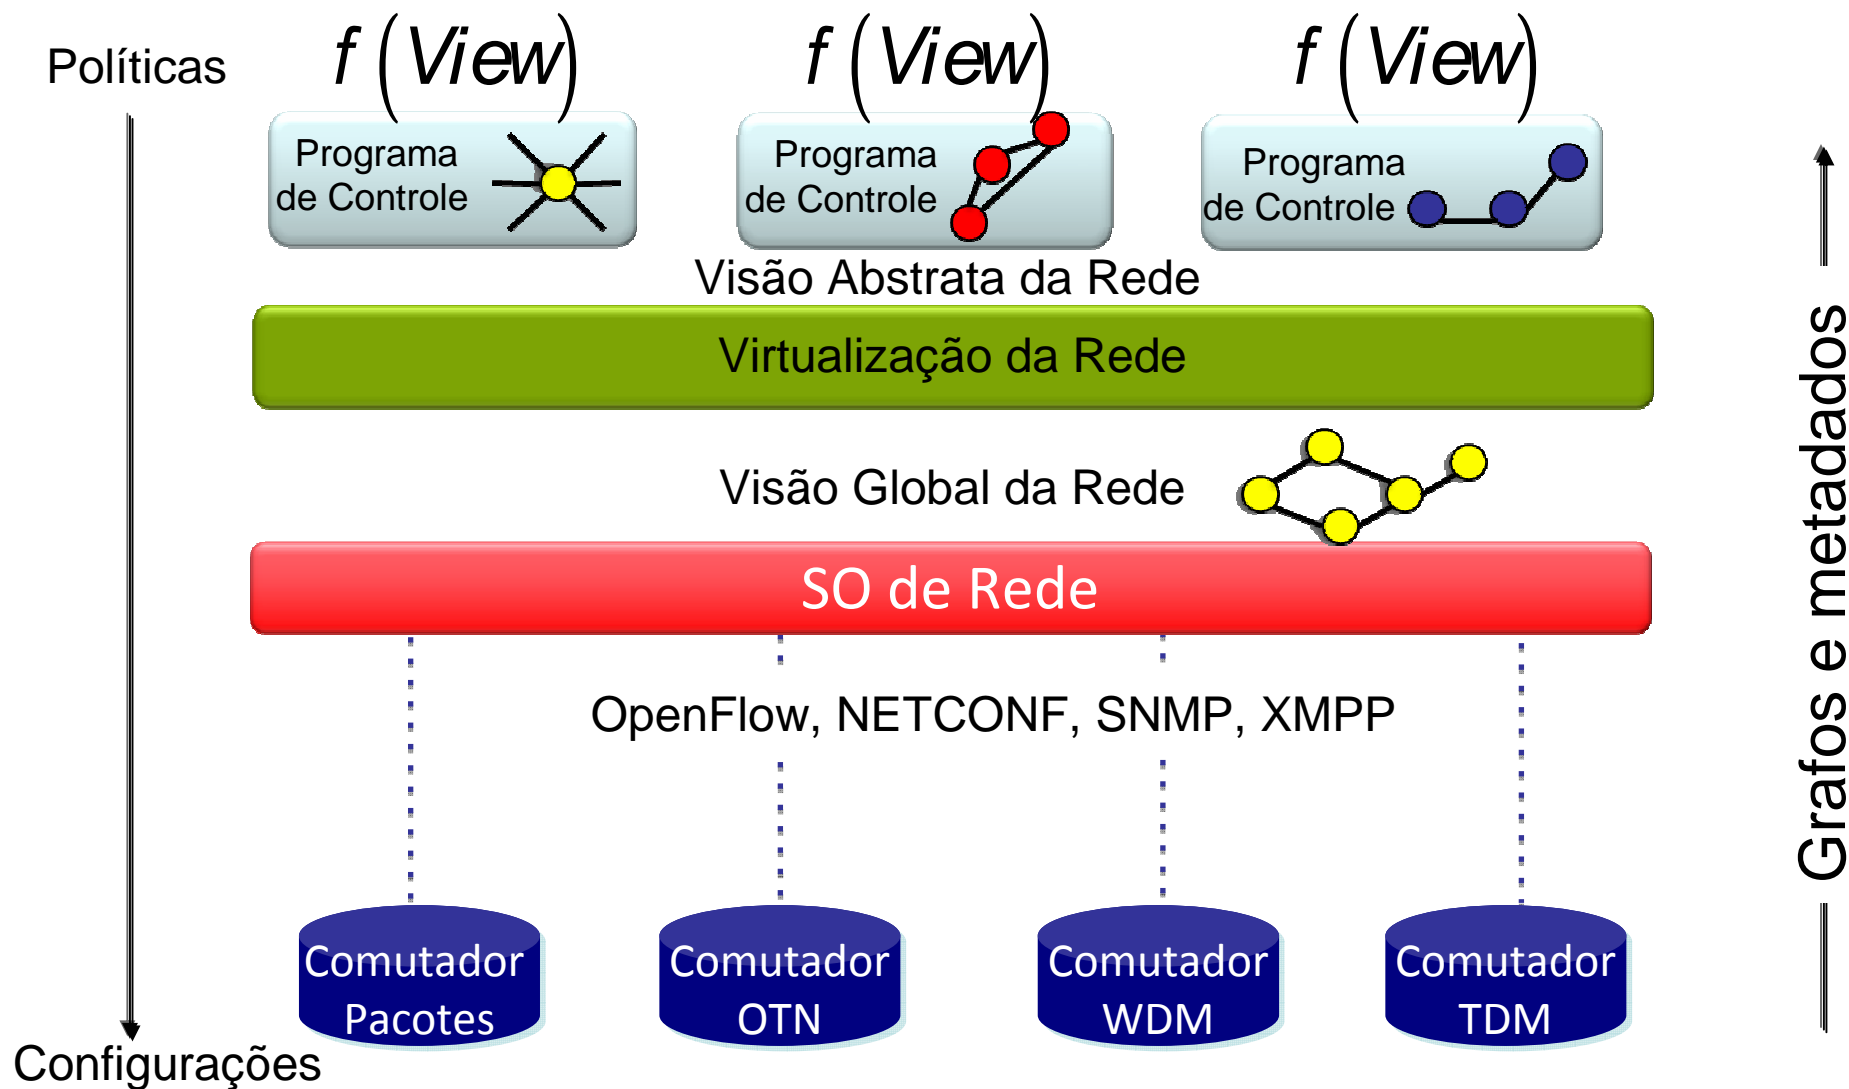

- Estamos no início de uma transição irreversível
 - Oportunidades para a indústria nacional
- SDN não é solução para todos os problemas
 - Mas certamente tem apelo em variadas aplicações
- Soluções SDN devem assumir longo período de transição e coexistência com legado
 - Equipamentos híbridos (tradicional/SDN)
 - Redes híbridas: equipamentos tradicionais e equipamentos SDN
 - Soluções que agreguem valor à infraestrutura existente, seja reduzindo custos ou aumentando receitas
 - Algumas exceções (ex.: datacenter de nuvem) podem seguir abordagem SDN 100% OpenFlow
- Oportunidades para a tecnologia nacional em comunicações seguras anti-espionagem

Visão de SDN

Convergências Vertical e Horizontal

• **Visão de SDN:**
Controlador

- **Escopo de SDN:**
Migração gradual para SDN

Software Defined Optical Transport

- Flexgrid ROADMs and adaptive transponders
- Embracing NETCONF and YANG modeling
- GMPLS emulated services and hybrid models
- Application of cognitive algorithms

Software Defined IP Routing 

- Bridging IP routing and OpenFlow
- Moved to OF 1.3 and multi-controller support
- Brazilian industry embracing OpenFlow/SDN
- First operation pilots reveal added value
- Increasing user/developer community

Software Defined Wireless Networking

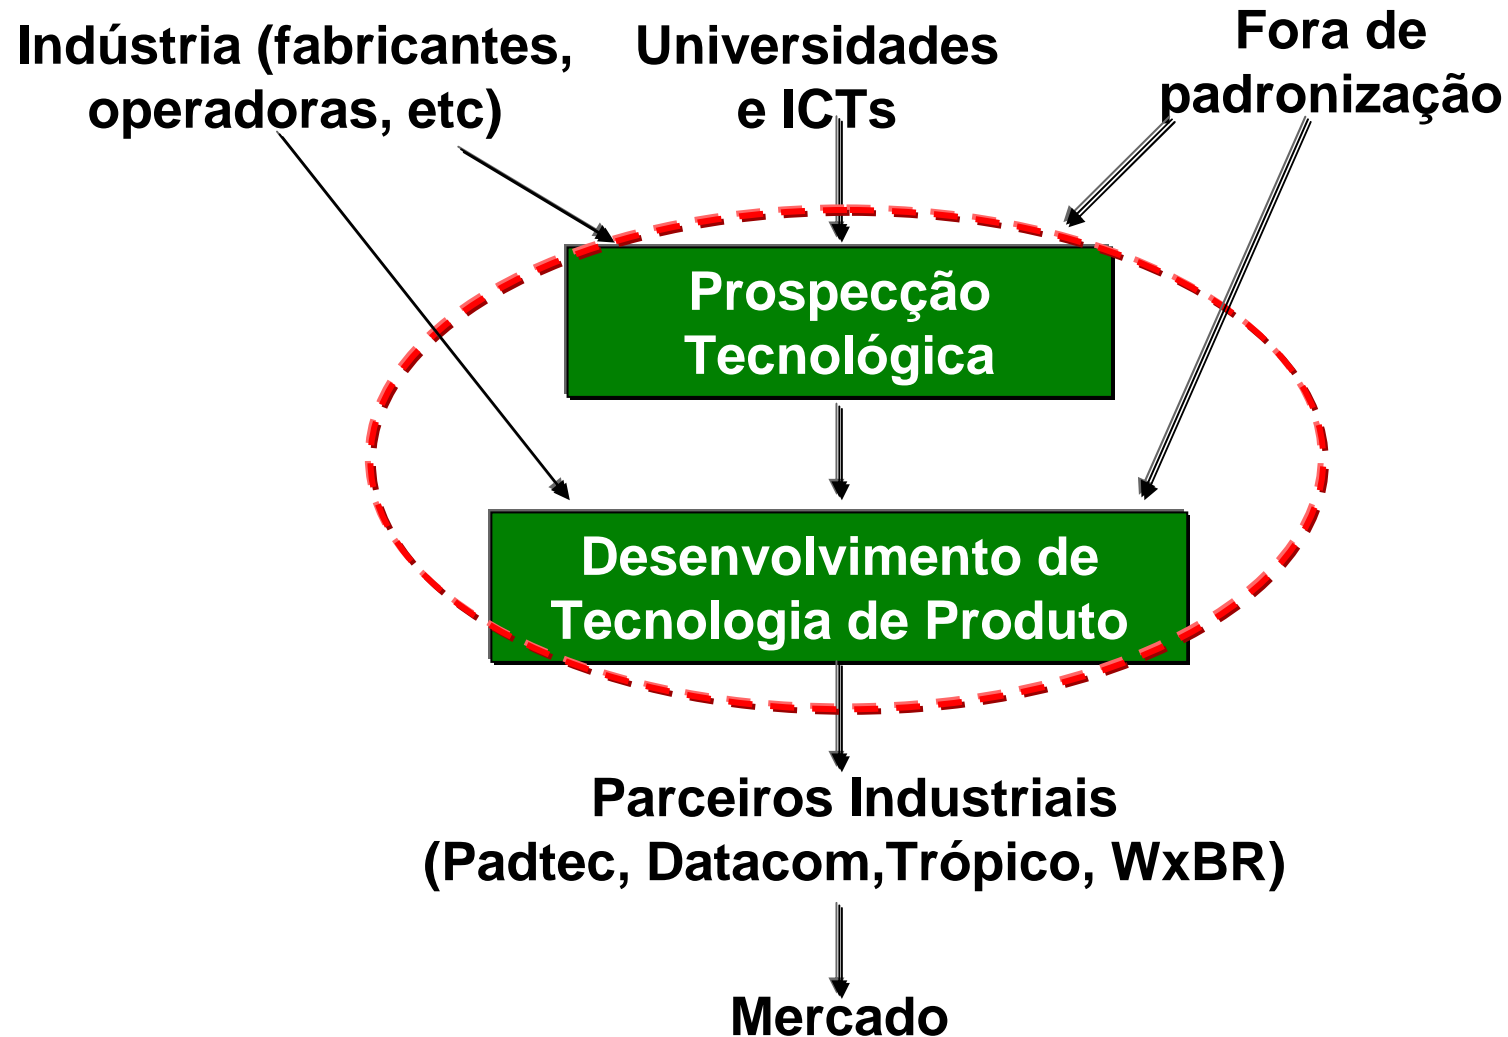

- Control OpenFlow 1.3 WiFi router (OpenWRT)
- Consumer-friendly home management
- Control OVS in Linux-based devices (eg. TV)?
- Investigate mesh routing scenarios
- Integration w/ cognitive radio capabilities

Software Defined Telecom Services

- From NGN Diameter interfaces to OpenFlow
- Integrate OSS/BSS with dynamic SDN control
- Hybrid cloud network transport services
- Link with Network Functions Virtualization (NFV) and network management outsourcing

SDN no CPqD

Processo de P&D

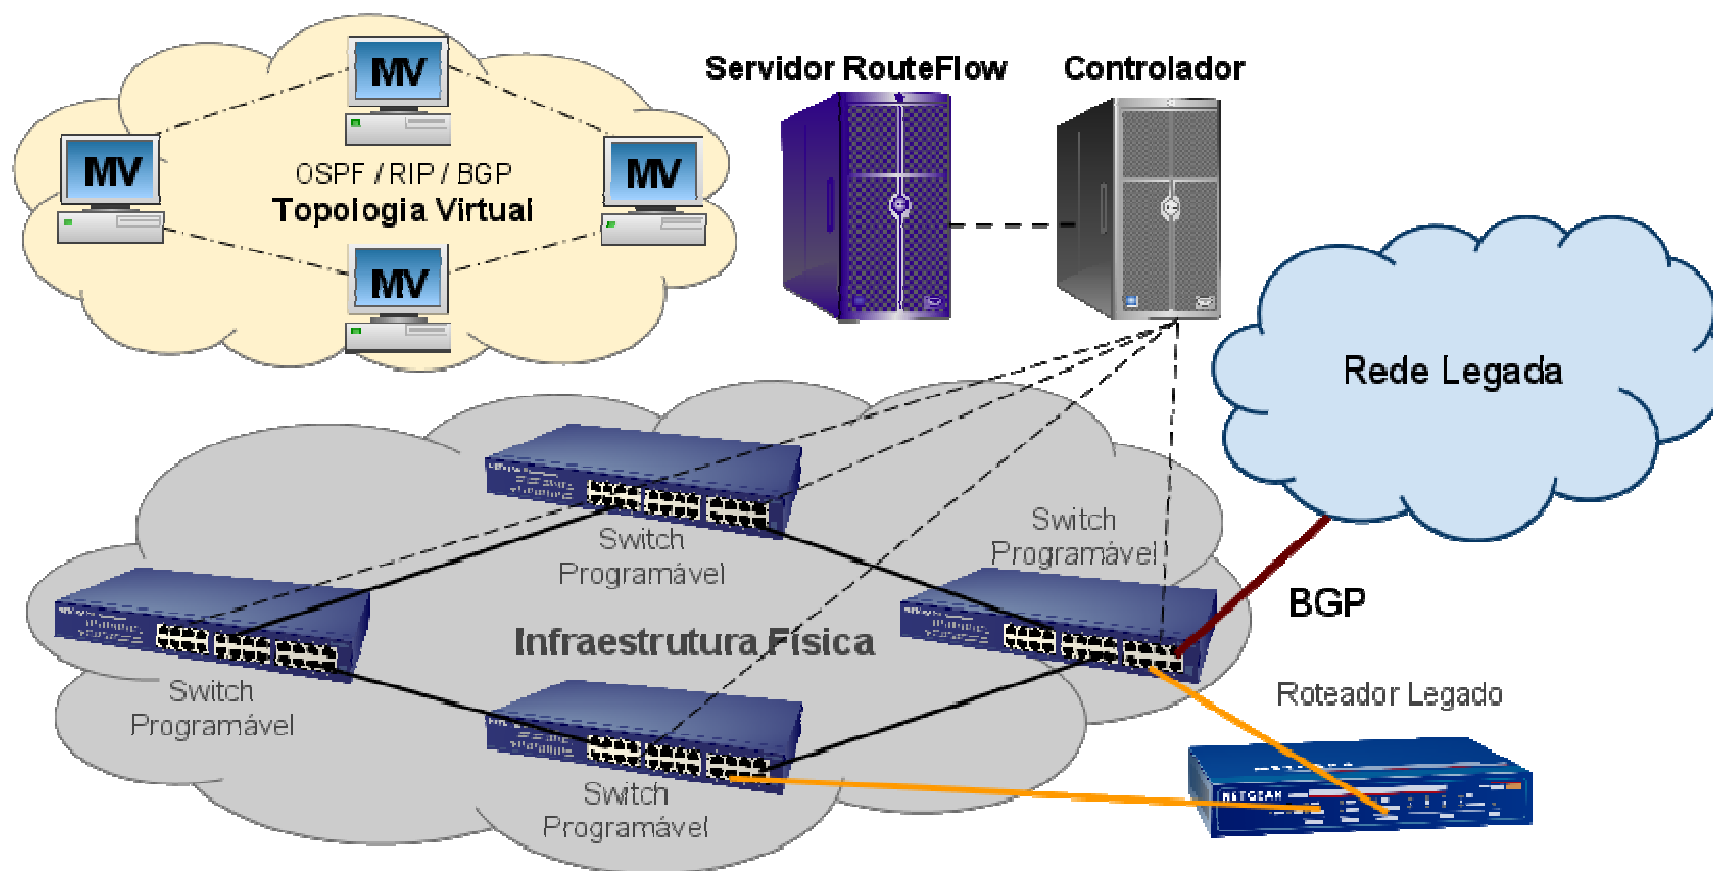

RouteFlow

<http://cpqd.github.io/RouteFlow/>

From the labs to production

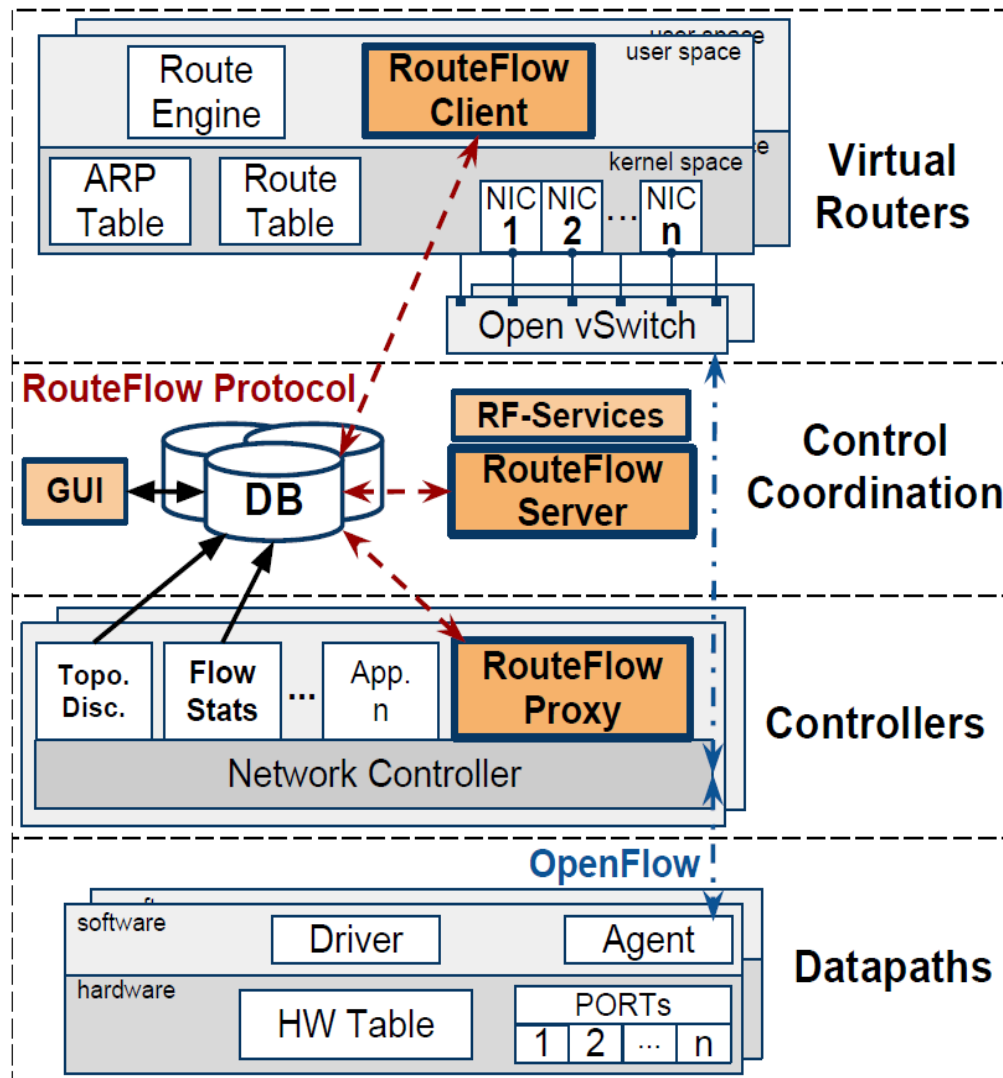

RouteFlow

***Leverages open source routing Linux suites such as Quagga
Interoperates with legacy routers and routed networks***

RouteFlow Architecture

Built for robustness and scale

Key Features

Modular architecture

- RF-Proxy
- RF-Server
- RF-Client

Database layer

- JSON-based IPC
- Resilient core state
- Programmer-friendly

Multi-Controller support

- NOX, POX, Ryu, Floodlight,

OpenFlow version

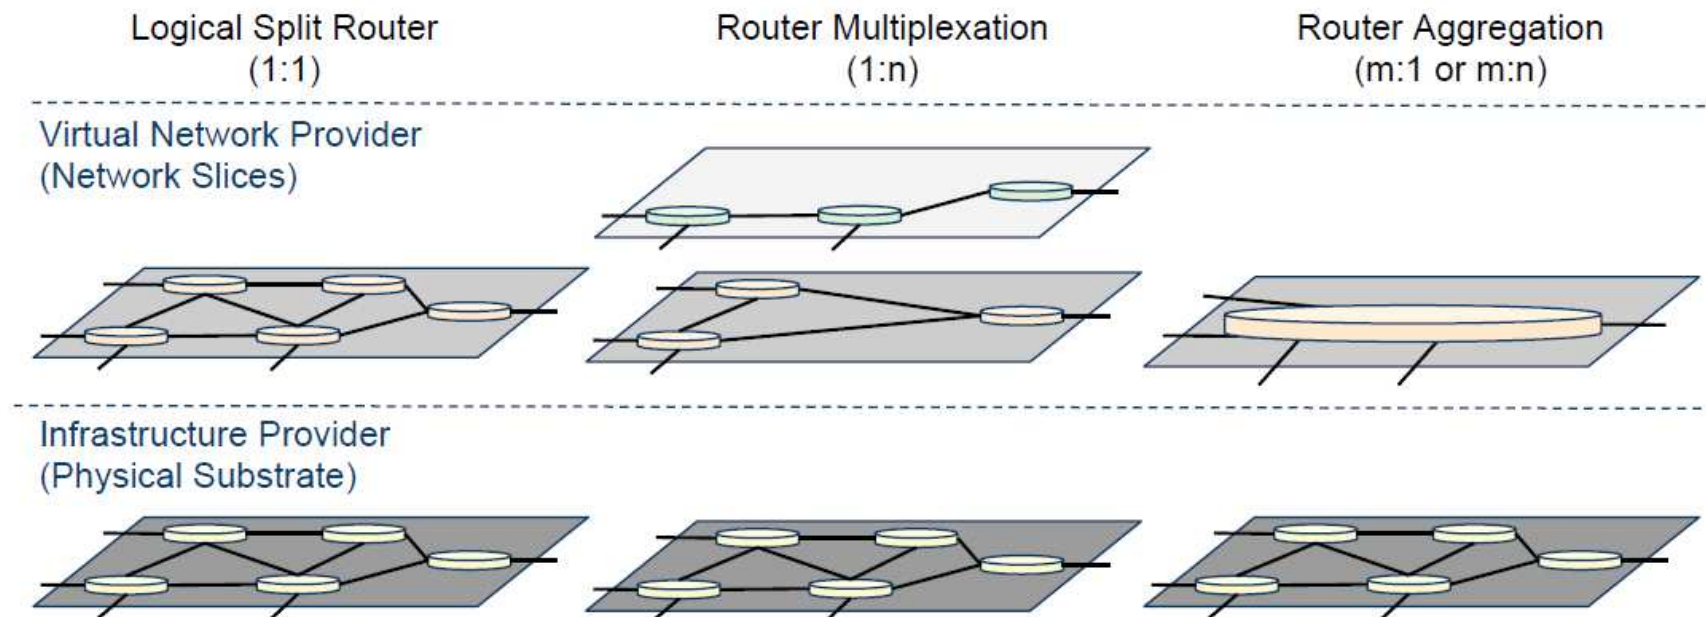

- 1.0: NOX, POX, Ryu, Floodlight
- 1.2/1.3: Ryu

* *RouteFlow-specific blocks in orange*

Modes of operation

From logical routers (akin VRFs) to single node abstractions over flexible virtual networks

New design choices on the distribution of the control nodes

RouteFlow WebUI

The screenshot shows the 'switch8' configuration page. It features a network topology diagram on the left with nodes for switch8, switch7, switch3, and Router1 Server. On the right, there is a 'Description' section for 'switch8' (Manufacturer: Nicira Networks, Inc., Hardware description: Open vSwitch) and 'Table statistics' (Table ID: 0, Name: classifier, Active count: 23, Lookup count: 0). Below this is a table with columns for 'Matches', 'Actions', 'Packets', and 'Bytes'.

Matches	Actions	Packets	Bytes
0	ip_dst: 96.10.23.0/24; ip_dst: 96.10.23.0/24	0	0
1	ip_dst: 96.10.23.0/24; ip_dst: 172.31.4.100	0	0
2	ip_dst: 96.10.23.0/24; ip_dst: 20.0.0.3	0	0
3	ip_dst: 96.10.23.0/24; ip_dst: 50.0.0.1	0	0
4	output: ip_dst: 0; ip_dst: 0	401	3372
5	ip_dst: 96.10.23.0/24; ip_dst: 172.31.1.92/4	2	196
6	ip_dst: 96.10.23.0/24; ip_dst: 10.0.0.92/4	0	0
7	ip_dst: 96.10.23.0/24; ip_dst: 10.0.0.92/4	0	0
8	ip_dst: 96.10.23.0/24; ip_dst: 172.31.1.92/4	2	196
9	ip_dst: 96.10.23.0/24; ip_dst: 172.31.1.92/4	19	1962

Topology and Statistics

The screenshot displays a table showing the current associations of VMs and datapaths in the RouteFlow network. The table has columns for VM ID, Vm port, Vx ID, Vx port, DP ID, and DP port. A yellow callout box explains that rows with all columns filled are active entries, and rows with only a VM ID or DP ID represent registered, idle, and never used VMs or datapaths.

VM ID	Vm port	Vx ID	Vx port	DP ID	DP port
0x00E1E78B7895660	1	0x000002320844ACE	3	0x0000000000000007	1
0x00E1E78B7895660	2	0x000002320844ACE	13	0x0000000000000007	2
0x00E1E78B7895660	3	0x000002320844ACE	12	0x0000000000000007	3
0x0000F707E4229D	1	0x000002320844ACE	9	0x0000000000000008	1
0x0000F707E4229D	2	0x000002320844ACE	1	0x0000000000000008	2
0x0000F707E4229D	3	0x000002320844ACE	8	0x0000000000000008	3
0x0000F707E4229D	4	0x000002320844ACE	7	0x0000000000000008	4
0x00136E72E81B334	1	0x000002320844ACE	10	0x0000000000000005	1
0x00136E72E81B334	2	0x000002320844ACE	2	0x0000000000000005	2
0x00136E72E81B334	3	0x000002320844ACE	4	0x0000000000000005	3
0x00136E72E81B334	4	0x000002320844ACE	5	0x0000000000000005	4
0x0007C3C33597DF3	1	0x000002320844ACE	14	0x0000000000000006	1
0x0007C3C33597DF3	2	0x000002320844ACE	11	0x0000000000000006	2
0x0007C3C33597DF3	3	0x000002320844ACE	6	0x0000000000000006	3

Resource Status and Mapping

The screenshot shows the 'Message' tab in RouteFlow, displaying a table of protocol messages between a 'Slave - Server' and a 'Server - Controller'. The table includes columns for 'To', 'Status', and 'Type'.

By message type:	To	Status	Type
VMRegisterRequest	0x0000F707E4229D	read	VMCConfig
VMRegisterResponse	0x00E1E78B7895660	read	VMCConfig
VMCConfig	0x0007C3C33597DF3	read	VMCConfig
VMCConfig	0x000136E72E81B334	read	VMCConfig
RouteInfo	0x0000F707E4229D	read	VMRegisterResponse
FlowMod	if-server	read	VMRegisterRequest
DatapathJoin	0x00E1E78B7895660	read	VMRegisterRequest
DatapathLeave	0x0007C3C33597DF3	read	VMRegisterResponse
VMMap	if-server	read	VMRegisterRequest
VMMap	0x000136E72E81B334	read	VMRegisterResponse
VMMap	if-server	read	VMRegisterRequest

RouteFlow Protocol

The screenshot shows the 'Resource Graphs / Results' page in OpenNMS. It features three line graphs: 'PACKETS', 'TIPACKETS', and 'RIBBYTES'. The 'PACKETS' graph shows a peak at 12:00 with a value of 1.05. The 'TIPACKETS' graph shows a peak at 12:00 with a value of 1.95. The 'RIBBYTES' graph shows a peak at 12:00 with a value of 1.95. The graphs are for the time period 'From Mon Mar 26 16:20:38 BRT 2012 To Tue Mar 27 16:20:38 BRT 2012'.

Routing configuration at your fingertips

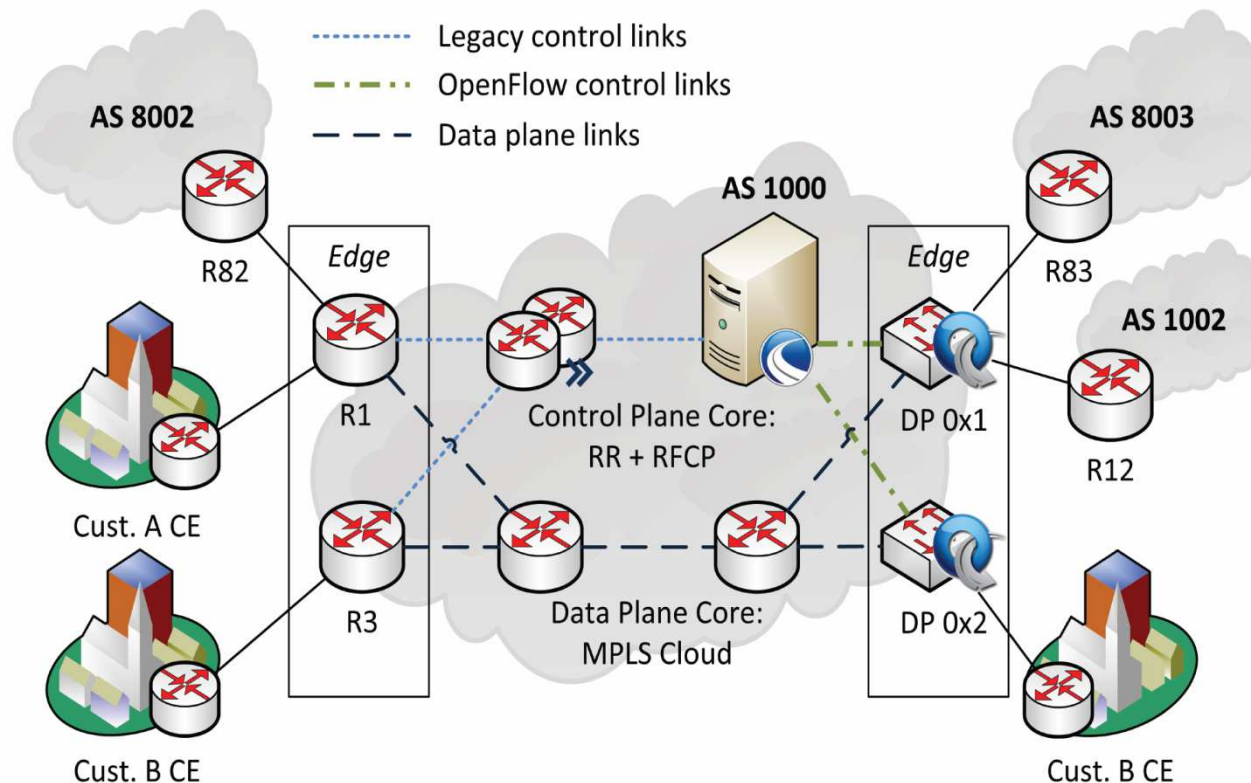

More than a solution... an Innovation Platform

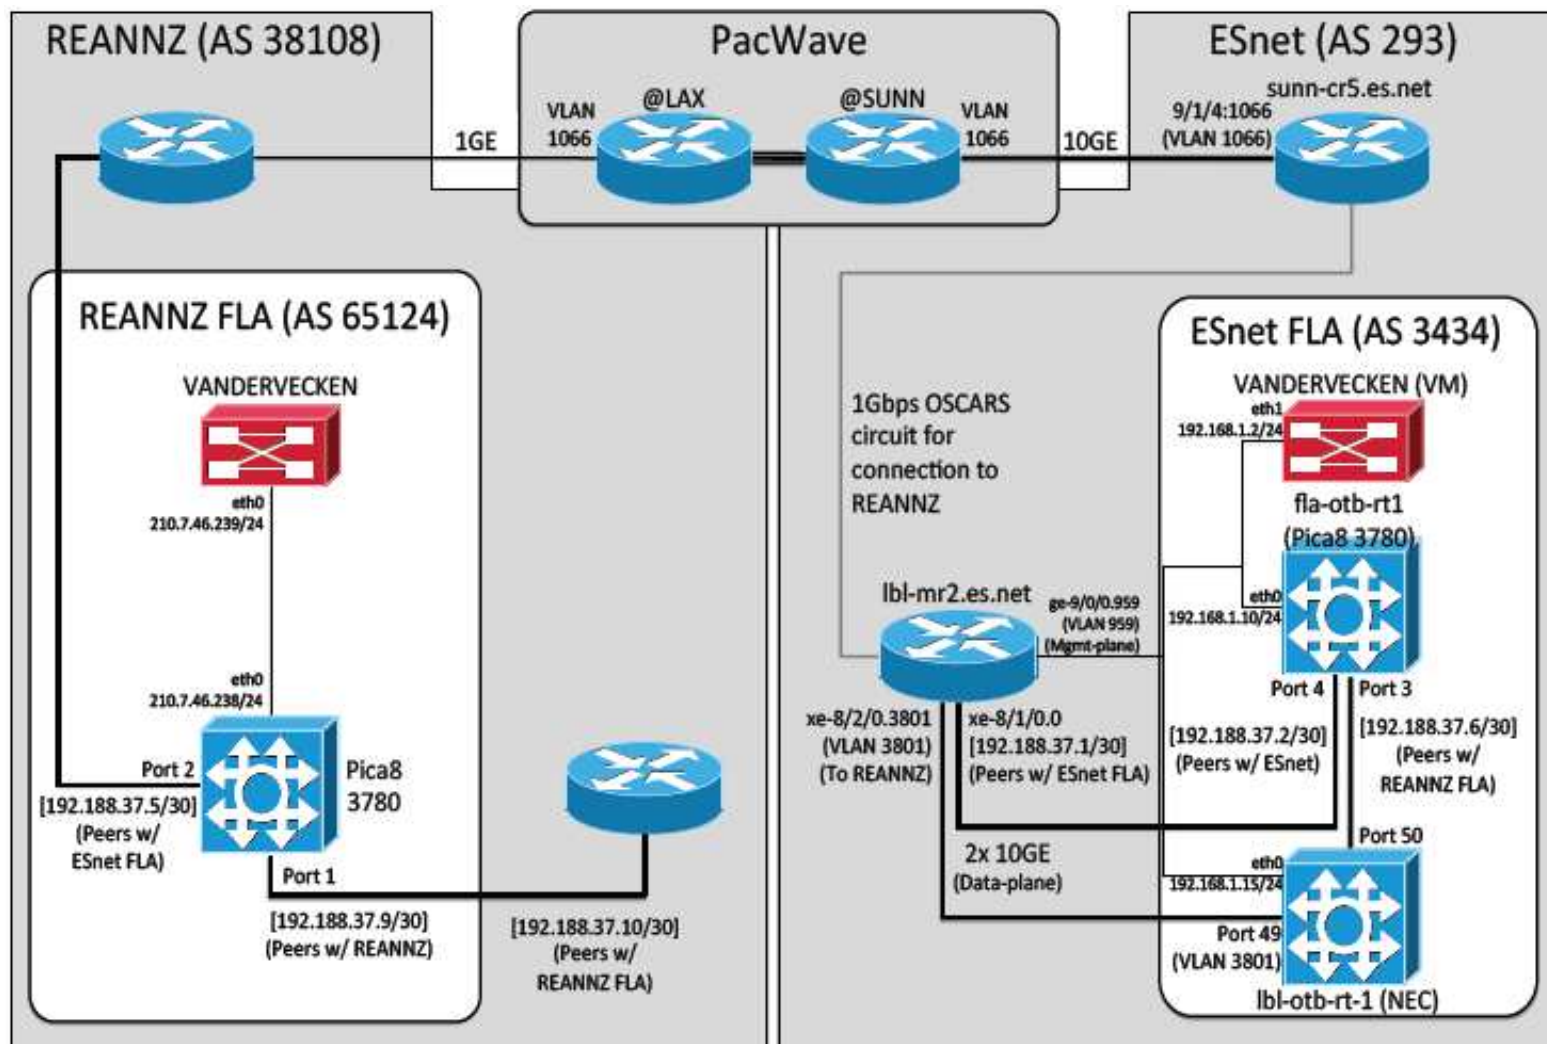

Controller-Centric Hybrid Networking

A migration path to roll out OpenFlow technology
 Not a revolution, but an evolution of current iBGP RRs to essentially eBGP Route Controllers

- “BGP-free edge”: A cost-effective simplified edge for SW-driven innovations

- International BPG peering using RouteFlow
- Route aggregation: 40% reduced FIB size

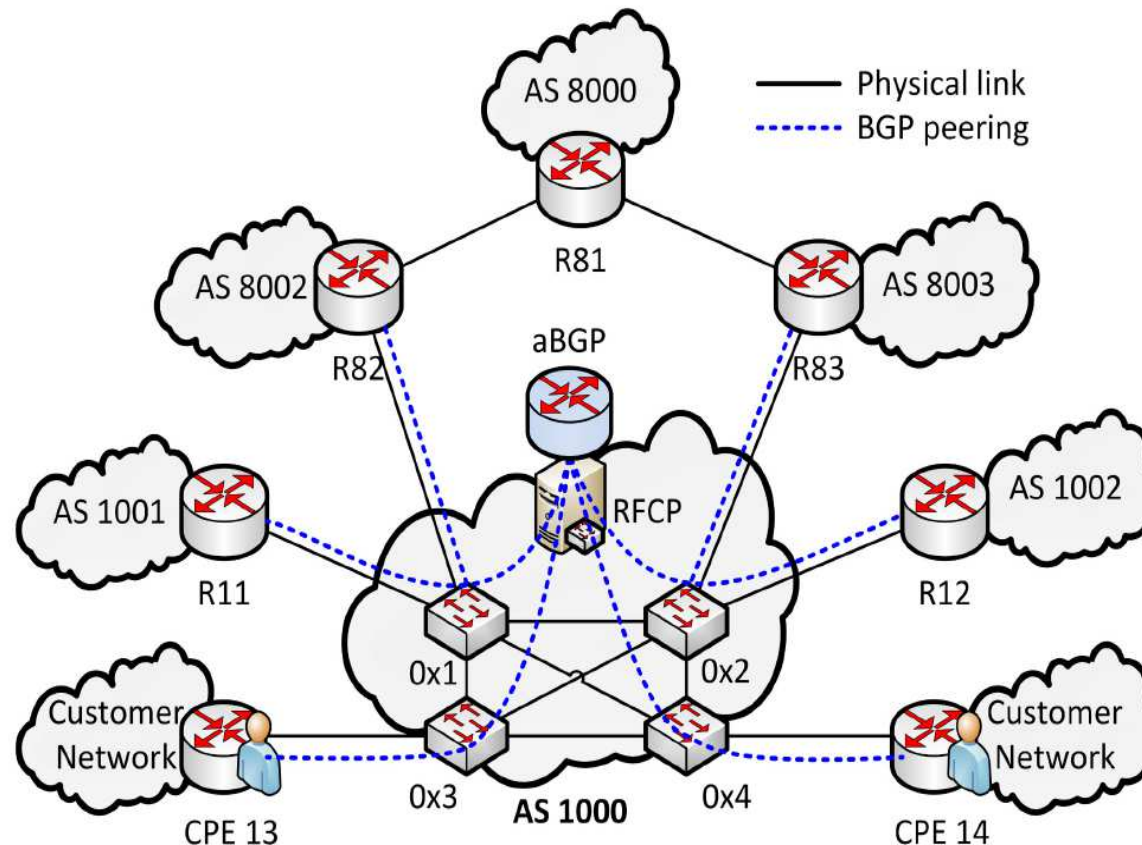

Aggregated BGP routing service → RCP

Single node abstraction of a domain-wide eBGP router

- Think modern multi-chassis routing architectures with external route processors and OpenFlow switches acting as line cards

Aggregation logic defined in the RF-Server

Distributed IX Router

RouteFlow in production (ONS 2013 demo)

DEMO 3

Distributed IX Router

Highlights

Deploying a distributed routing fabric
Production traffic in live IXP

Reduced operational complexity

Easier to understand
Aids modification and diagnosis

Snapshot: 1134 flow entries in each switch

8 flows matching control plane traffic
(e.g., ARP, ICMP, BGP, etc.)

1 flow entry to drop traffic by default

98 flows describing BGP speakers

1028 flows representing L3 routes

CPqD Ports OpenFlow to New Platform

October 13th, 2010, dtalayco in [OpenFlow Blog](#)

CPqD is a private non-profit Brazilian R&D foundation. Recently they announced the first switch in South America to support the OpenFlow 1.0 specification. The switch uses Broadcom L2/L3 silicon with 24 x 1Gb ports and 2 x 10Gb ports. It has a high performance CPU running the Indigo-beta-4 release from Stanford.

Tens of these OpenFlow switches will be deployed in Project GIGA's High-speed Experimental Network, an IP/Ethernet/WDM network testbed run by CPqD and RNP (Brazilian NREN). Today the GIGA network connects 66 research labs at multigigabit per second the southeast region of Brazil, but will soon be upgraded to support 100Gb/s bit rates, using technology developed in project GIGA, and expanded to all the other regions of the country, using RNP's resources.

This large-scale OpenFlow infrastructure will be fundamental to the national initiative on Future Internet that CPqD and RNP, amongst others, are leading, as well as to support collaborative experiments related to projects GIGA and GENI.

The development of the OpenFlow switch and the development of an IP routing stack solution outside the switches on top of NOX (stay tuned!) are under the Future Internet umbrella of the current R&D program, which includes a number of projects, such as Project GIGA.

CPqD was the R&D branch of Brazil's telephony monopoly system until 1997, when the whole system was privatized. Since then CPqD is a private foundation with the goal of bridging the gap between university research and product development, helping (mainly) local companies to innovate and compete in the market. Today CPqD has more than 30 years of existence and 1200 employees carrying out various activities on various ICT sectors.

OpenFlow™ Driver Competition

Write the Best OpenFlow Software Driver and Win US\$50,000

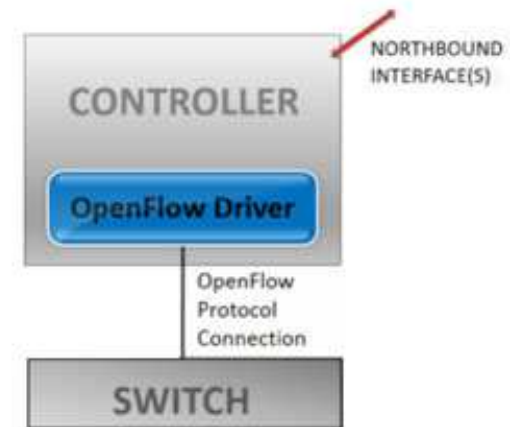

- Overview
- Competition Goals
- Submission Requirements
- Competition and Submission Guidelines
- ONF Commitment
- Judging Criteria
- Prize

CPqD implementation:

- Fully compliant to OpenFlow 1.3 and 1.0
- C++ with binding to Java and Python
- Compilation to Linux PC and Android/ARM
- 6-million flows per second under a learning switch application

Figure 1. OpenFlow Protocol Software Driver Controller/Switch Interaction

Comentário Finais

- **Transição para SDN parece irreversível**
 - De forma gradual, coexistindo e adicionando valor ao legado, seja pela otimização da operação ou agilidade na oferta de novos serviços
- **SDN apresenta oportunidades inéditas**
 - Para a tecnologia nacional, para os fabricantes, para as operadoras e os provedores
- **CPQD está atuando em com parceiros industriais (ex.: Datacom) para construir soluções tecnológicas campeãs**

Comentário Finais

- O CPqD tem contribuído para o avanço do estado da arte de SDN/OpenFlow
 - Dynamic Circuit Services (2010): solução SDN de provisionamento automático de circuitos, com garantia de qualidade e proteção, pelo próprio cliente em redes multi-tecnologia (ex.: Ethernet e WDM)
 - Switch (de 10G) puramente OpenFlow (2010): 1o. desenvolvido na LATAM
 - RouteFlow (2011): única solução de roteamento IP virtualizado para SDN/OpenFlow disponível no mundo
 - Software Switch OpenFlow 1.3 (2012): único switch OpenFlow 1.3 completo e kit completo correspondente disponível no mundo; base para protótipo OF 1.4 da ONF e framework de testes de OF
 - Plugin OpenFlow (2013): plugin OF 1.3/1.0 em C++ (6 milhões de fluxos por segundo!) com suporte a binding para Java e Python e compilável em Linux PC e Android/ARM – concorrente na competição internacional da ONF
 - Participante ativo na ONF e na OIF no contexto de SDN
