

# A Tale on Software Defined Networking

Christian Esteve Rothenberg

*TURNING  
INTO REALITY*

# Disclaimer

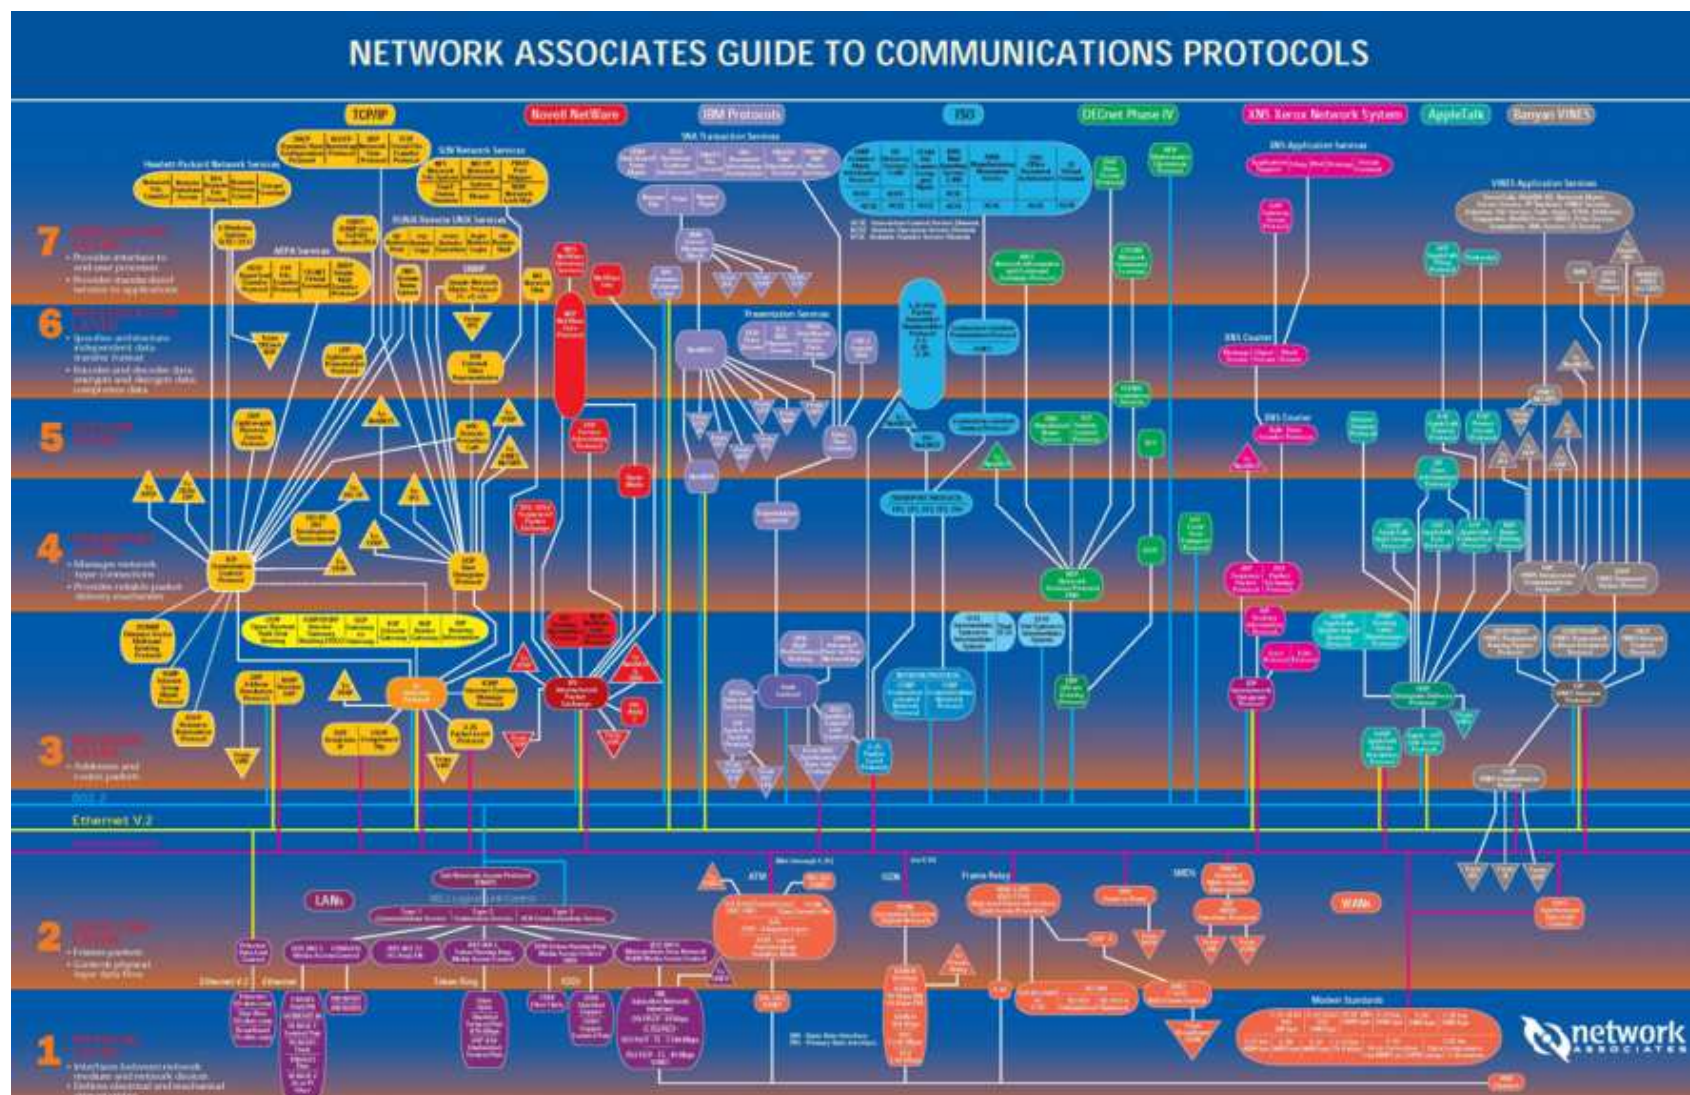

## Personal view on SDN

- Not by CPqD
- Not by ONF (or any affiliated company)

## Actually, not that personal and original...

- See References and Credits

# Where are we today?

Many complex functions baked into the infrastructure

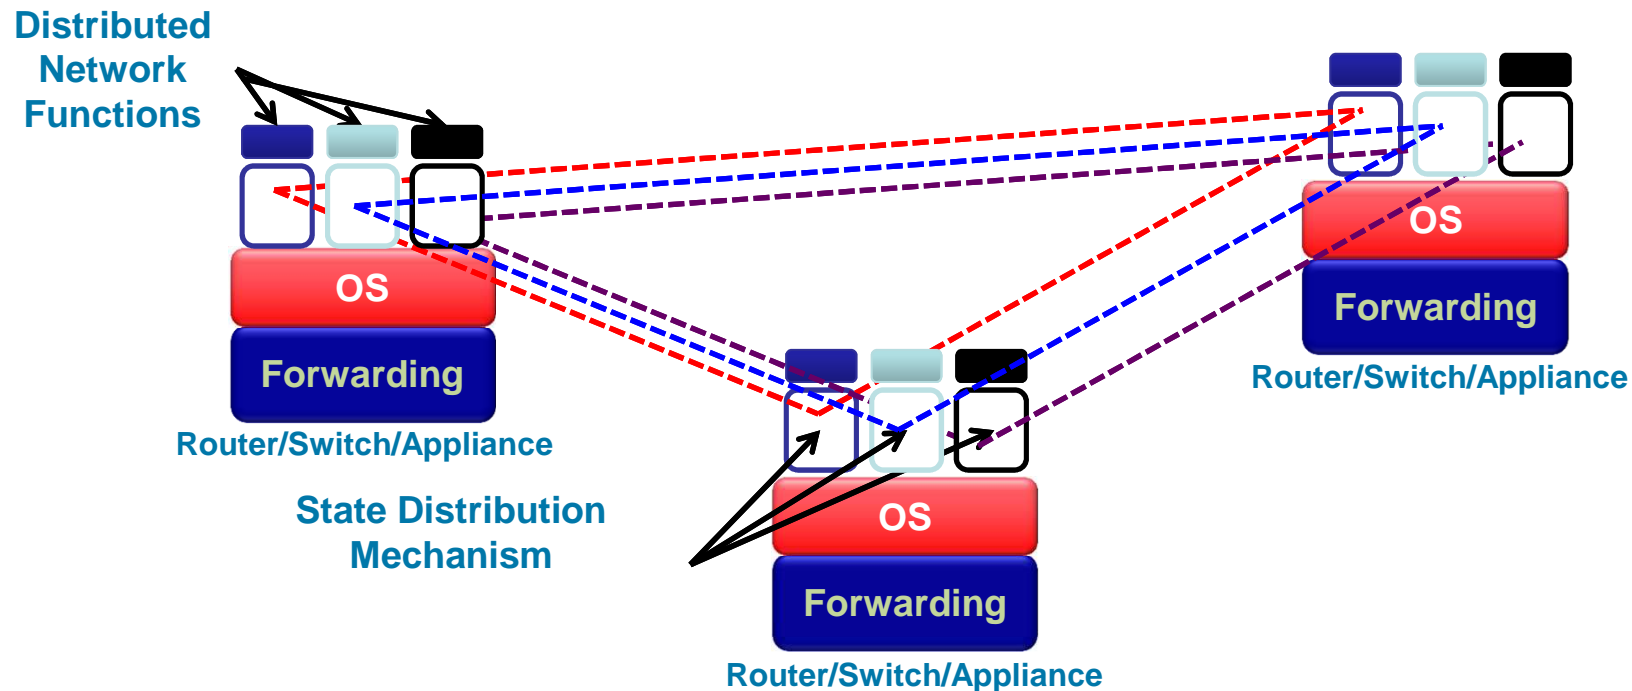

*OSPF, BGP, multicast, differentiated services,  
Traffic Engineering, NAT, firewalls, MPLS, redundant layers, ...*

An industry with a “mainframe-mentality”

Source: Stanford/Berkeley

## Problem: No Abstractions for Control Plane

- Addition of a new function to the network
  - Highly complex distributed system problem
- Networks too difficult to program and to reason about
- no good abstractions and interfaces

**Not good for even network vendors!**

Source: Stanford/Berkeley

## How did we get here?

A guaranteed recipe for disaster

1. Invent a new data plane mechanism
2. Hack a new control plane for it
3. Jump back to 1

Physical topology drove the control design

*The ability to master complexity is not the same as the ability to extract simplicity*

--S. Shenker

# SDN to the rescue!

## Software Defined Networking

Warning: Contains optimism  
(Plug to <http://PacketPushers.net> for Unicorn Humor!)

Source: [packetpushers.net](http://packetpushers.net)

## What is SDN?

*In the SDN architecture, the control and data planes are decoupled, network intelligence and state are logically centralized, and the underlying network infrastructure is abstracted from the applications.*

-- Open Networking Foundation white paper

OpenFlow is SDN, but SDN is not OpenFlow”

- Does not say much about SDN

*Let`s call whatever we can ship today SDN*

-- Vendor X

*SDN is the magic buzzword that will bring us VC funding*

-- Startup Y

*SDN is the magic that will get my paper/grant accepted*

-- Researcher Z

## Ethane

1. Programmatic control of Enterprise networks
2. Global policy, directly enforced
3. Global vantage point
4. OpenFlow

**Research Community:**  
How to deploy new ideas?

1. NSF/GENI
2. OpenFlow/SDN on 10 campuses
3. Research demonstrations
4. Now on 100+ campuses
5. US, Europe, Asia, Brazil

**Industry Trend:**  
Networks being built this way

1. Data Center Networks
2. WANs
3. Enterprise and WiFi
4. Vendors startups emerging

# OpenFlow standards

## Evolution path:

- **OF 1.0 (03/2010):** Most widely used version, MAC, IPv4, single table (from Stanford)
- **OF 1.1 (02/2011):** MPLS tags/tunnels, multiple tables, counters (from Stanford)
- **OF 1.2 (12/2011):** IPv6, extensible expression
- **OF-Config 1.0 (01/2012):** Basic configuration: queues, ports, controller assign
- **OF 1.3.0 (04/2012):** Tunnels, meters, PBB support, more IPv6
- **OF-Config 1.1 (04/2012):** Topology discovery, error handling
- **OF-Test 1.0 (2H2012):** Interoperability conformance test processes, suites, labs
- **OF 1.3.2 (est. May 2013),** 19 errata, final review
- **OF 1.4 (est. June 2013),** 9 changes + 13 extensions

## Goals:

- **Widespread adoption, experimentation w/OF 1.3.x**
- **Accommodate current merchant silicon**
- **Move beyond limitations of current merchant silicon**

# Technical activities

## Chartered Working Groups

- **Extensibility (chair: Jean Tourrilhes, HP): OpenFlow protocol**
- **Config-mgmt (chair: Deepak Bansal, Microsoft): basic switch configuration**
- **Testing-Interop (chair: Michael Haugh, Ixia): conformance, interop., benchmarking**
- **Hybrid (chair: Jan Medved, Cisco): mixed OpenFlow/legacy switches networks → Migration WG**

## Discussion Groups

- **OpenFlow-Future: forwarding-plane models**
- **NorthboundAPI: how the network relates to the applications**
- **NewTransport: OpenFlow for optical, circuits, wireless**
- **Market Education (chair: Isabelle Guis, Big Switch): marketing, customer value**

## Some Interesting Use Cases

Use Case	Domains	Market Segments
DC Virtualization (Resource Slicing, Multi-tenant GW, Cloud Bursting)	Data Center (Edge - DC Edge)	Public Cloud High Performance
Data Center Interconnect	Data Center, Edge, WAN, Core	Public Cloud High Performance
Bandwidth Calendaring	WAN, Edge, Core	Public Cloud, High Performance, Service Providers, R&E
Multi-Layer Virtualization + Optimization	Core	SP, Public Cloud, High Performance, R&E
Content Request Routing (CDN)	Edge, Core, Data Center	SP
Virtual Patch Panel / Virtual Tap or Dynamic Traffic Steering	Campus & Branch, Datacenter, Core, Edge	SP, High Performance Public Cloud, R&E, Enterprise IT
Dynamic Threat Mitigation	Campus & Branch, Data Center, Edge	SP, Public Cloud, High Performance, R&E, Enterprise IT
Network Access Control	Campus & branch	Enterprise IT

# Solution- or Problem-focused Research?

## solution-focused?

- assume SDN, then solve outstanding potential problems with it? e.g.
  - policy complexity
  - modelling scalability
  - inter-domain
  - validation of evolvability claims
  - ... see mailing list & other presentations (esp. Dave Ward's IAB plenary) for dozens more suggestions

## problem-focused?

- pre-standards convergence on best approach to solve a problem?
  - how does centralised FIB distribution compare vs decentralised vs hybrid?
  - is it best for forwarding isolation to be independent of performance isolation for virtual networks?
  - is it best to use the same architecture for FIB distribution and for config?
  - how best to do multipath & traffic engineering

# Mapping of technologies to problems

	forwarding isolation	performance isolation	orchestration / config	obj models / schemas	network control APIs
SDN ocean	<ul style="list-style-type: none"> <li>OpenFlow</li> <li>ForCES</li> <li>MPLS</li> <li>MPLS-TE</li> <li>IPsec</li> <li>TRILL</li> <li>SPB</li> </ul>	<ul style="list-style-type: none"> <li>Diffserv</li> <li>ConEx</li> </ul>	<ul style="list-style-type: none"> <li>OFconfig</li> <li>NETCONF</li> <li>SNMP</li> <li>RESTful</li> <li>Web UI</li> <li>CLI</li> </ul>	<ul style="list-style-type: none"> <li>Yang</li> <li>SID</li> </ul>	<ul style="list-style-type: none"> <li>ALTO</li> <li>CDNI</li> <li>XMPP</li> </ul>

- we could focus on solving a particular problem (column)
- we could also ask
  - is an integrated solution (multi-column) good?
  - or “do one thing and do it well” so operators can pick & choose rather than lock-in to an über-solution?

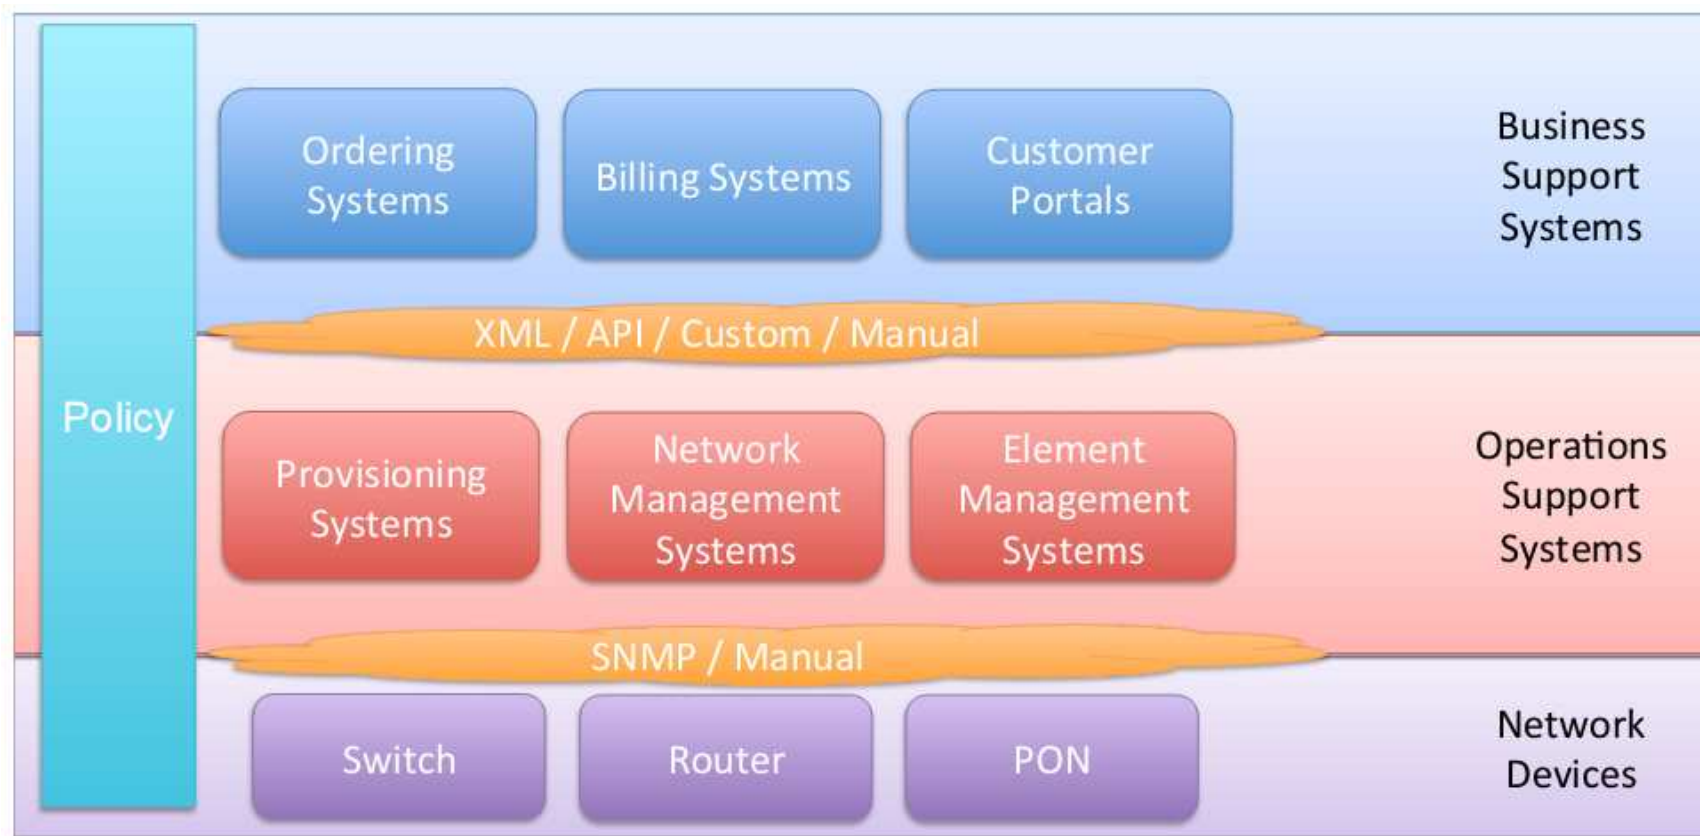

# Strategic Networking Paradigms for Network Operators

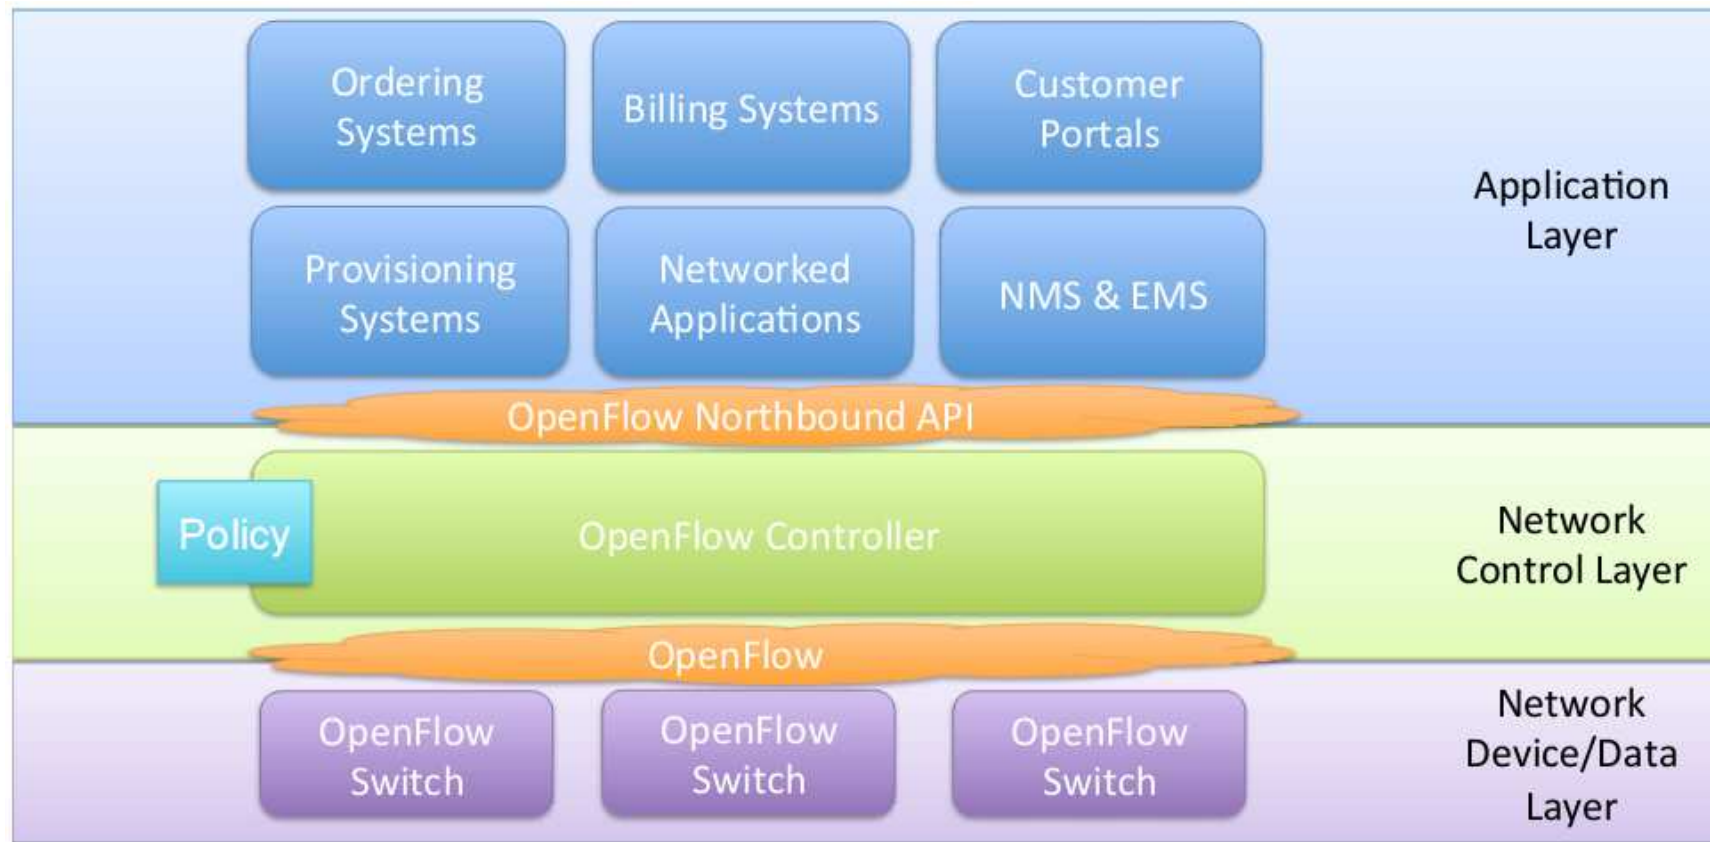

# **A VERY MUCH NEEDED DISCUSSION ON SDN MODEL(S)**

# Yesterday's SDN

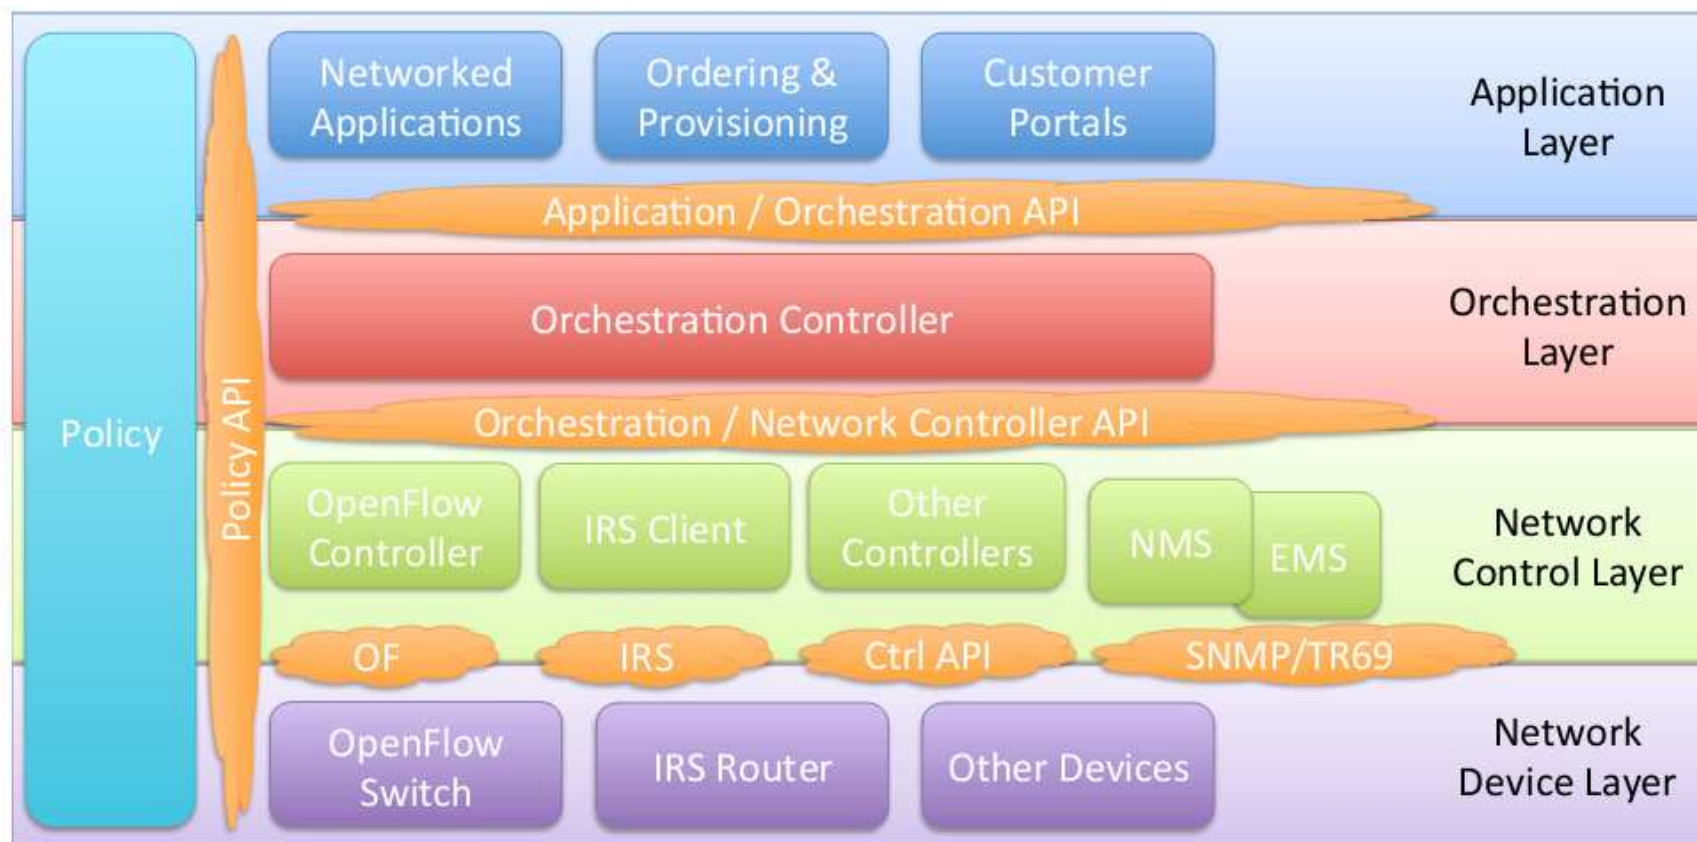

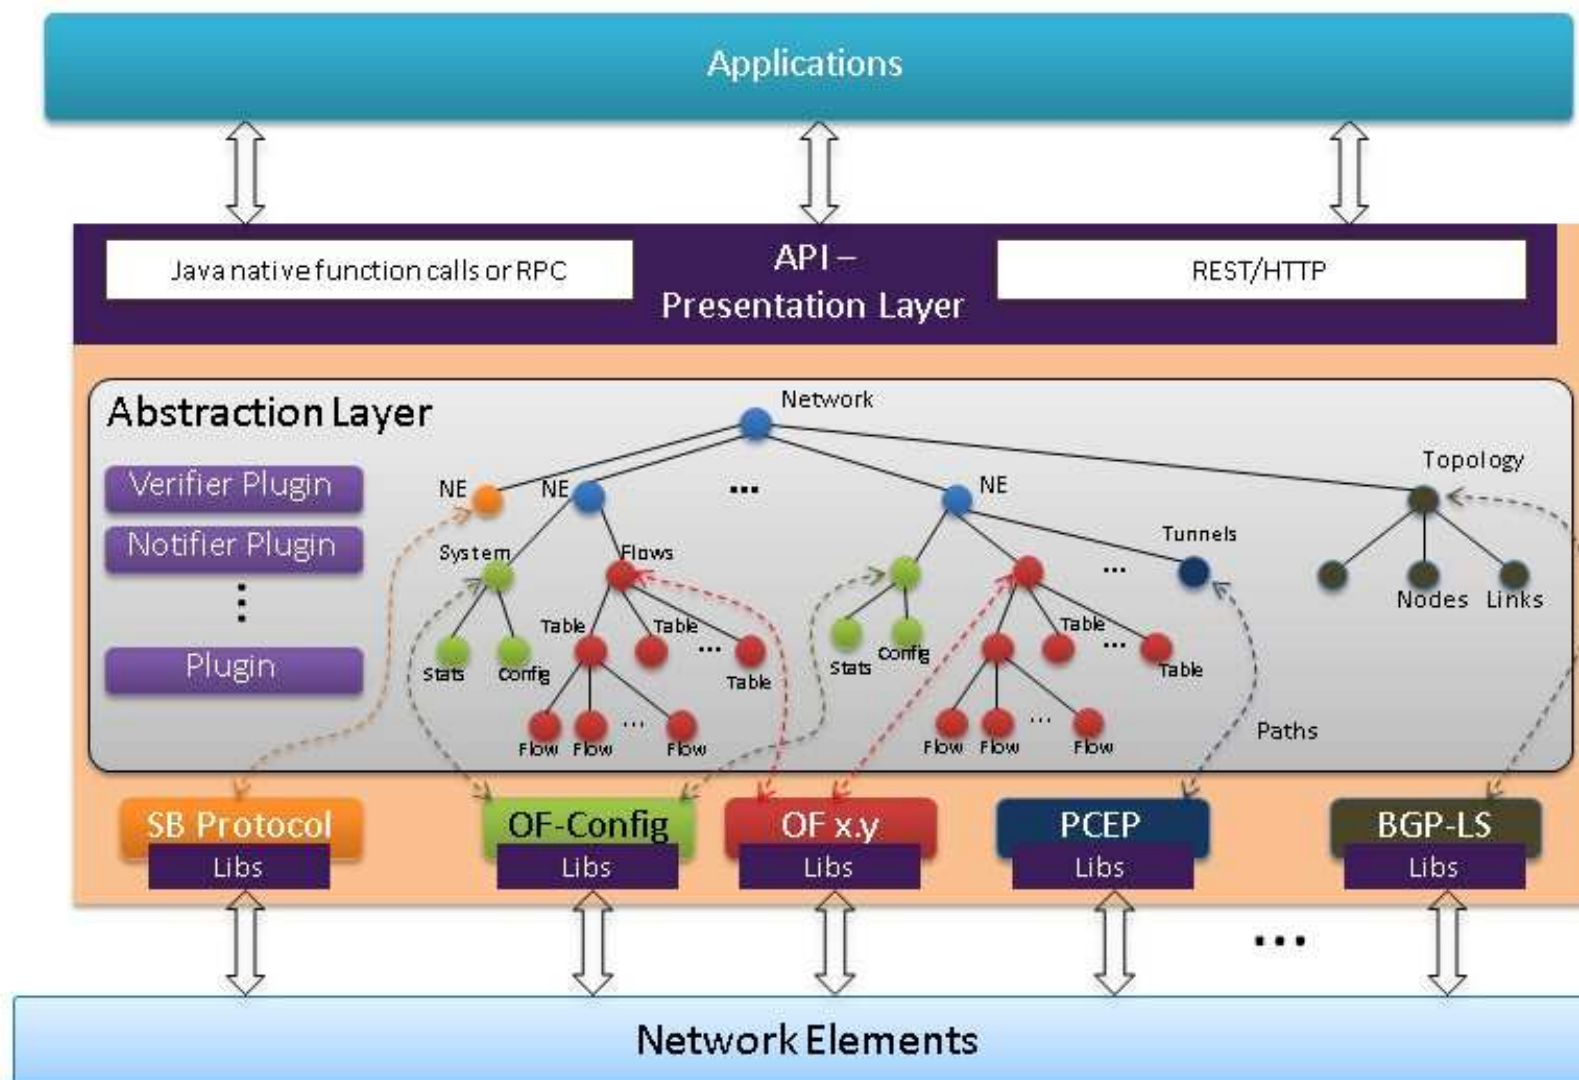

# The OpenFlow model

# Emerging SDN Ecosystem

# OpenDaylight Controller Platform

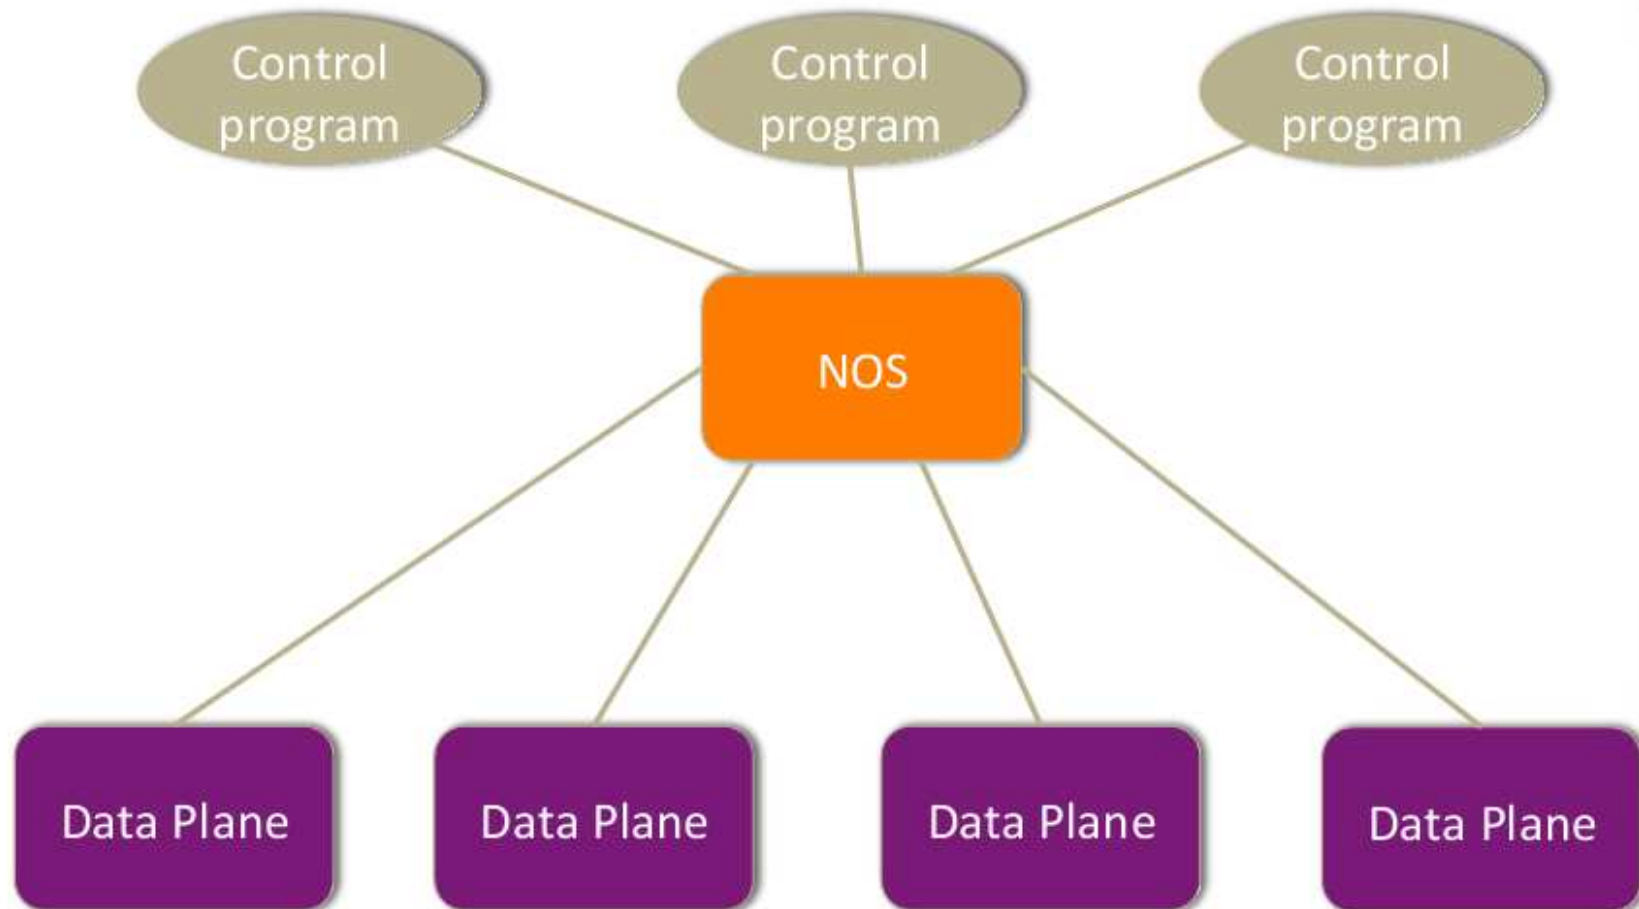

## SDN Models

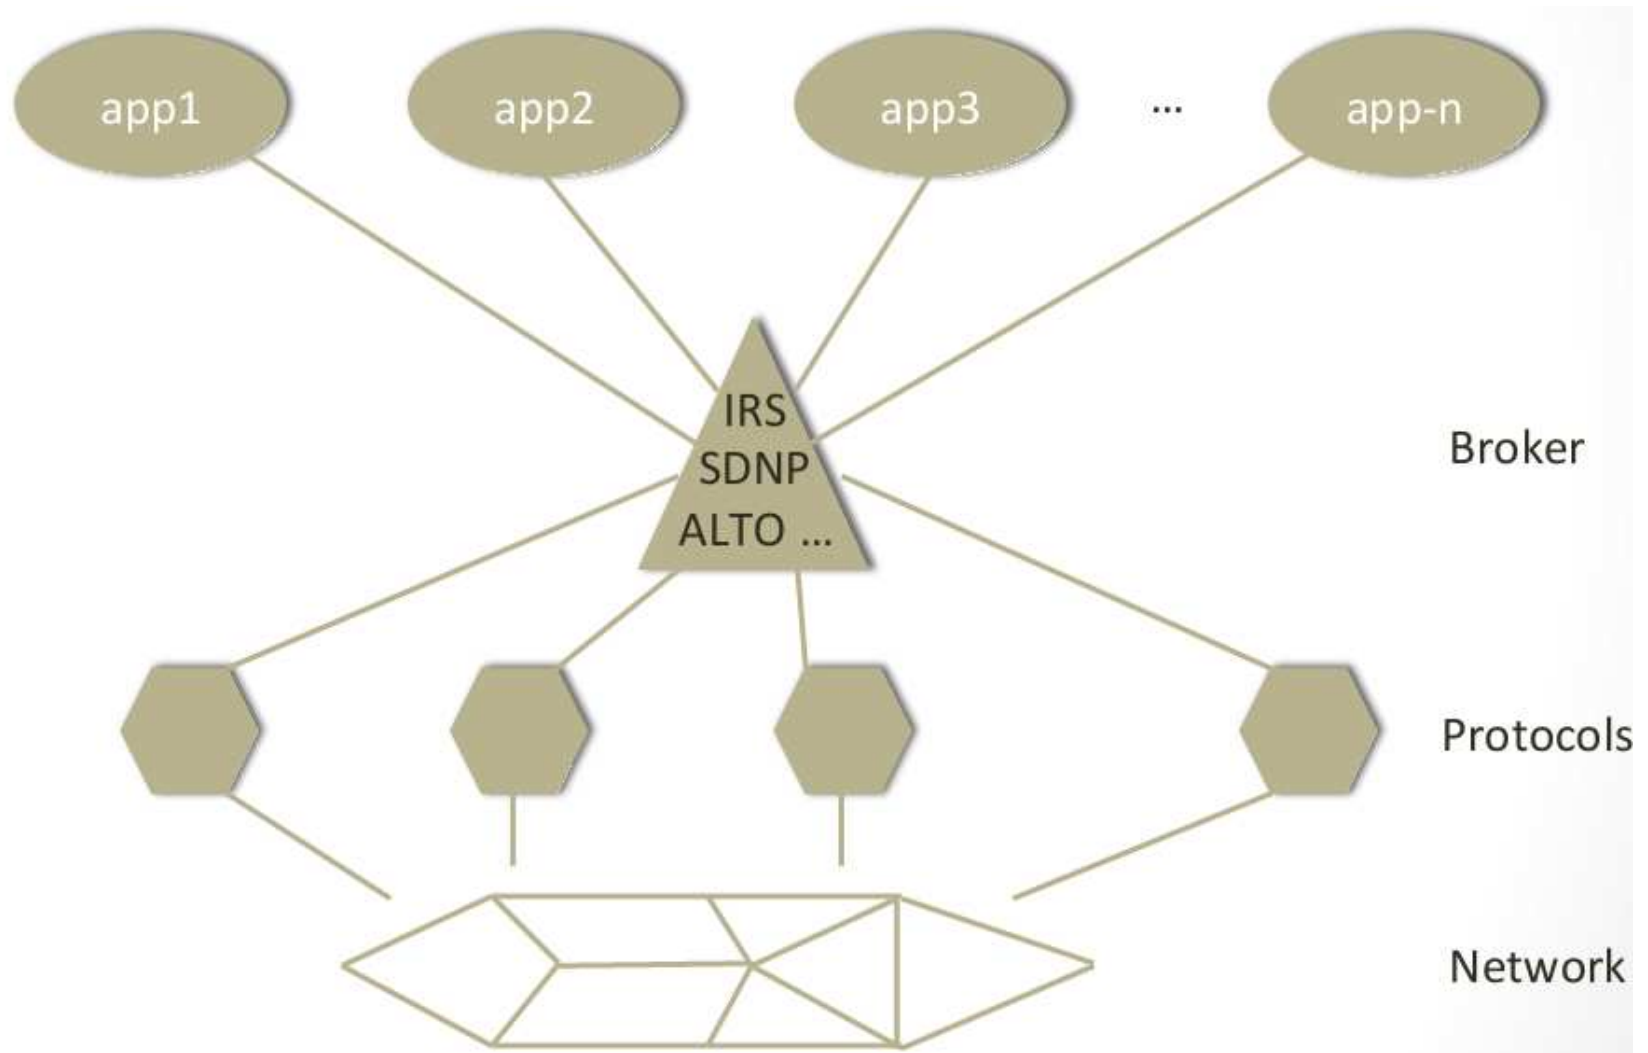

SDN can be considered in terms of three distinct models

- 1. A **Networking/Operating/System** that oversees the network data plane and hosts a number of “control programs” that define networking services
- 2. A **Broker** through which applications interact with and affect the network so that the apps are more effective, are more efficient and/or offer better user experience
- 3. A **Compiler** that translates a high-level language in which an operator defines what they want from the network and compiles it into low-level instructions for the data plane

## Model : Networking Operating System

# Model : Broker

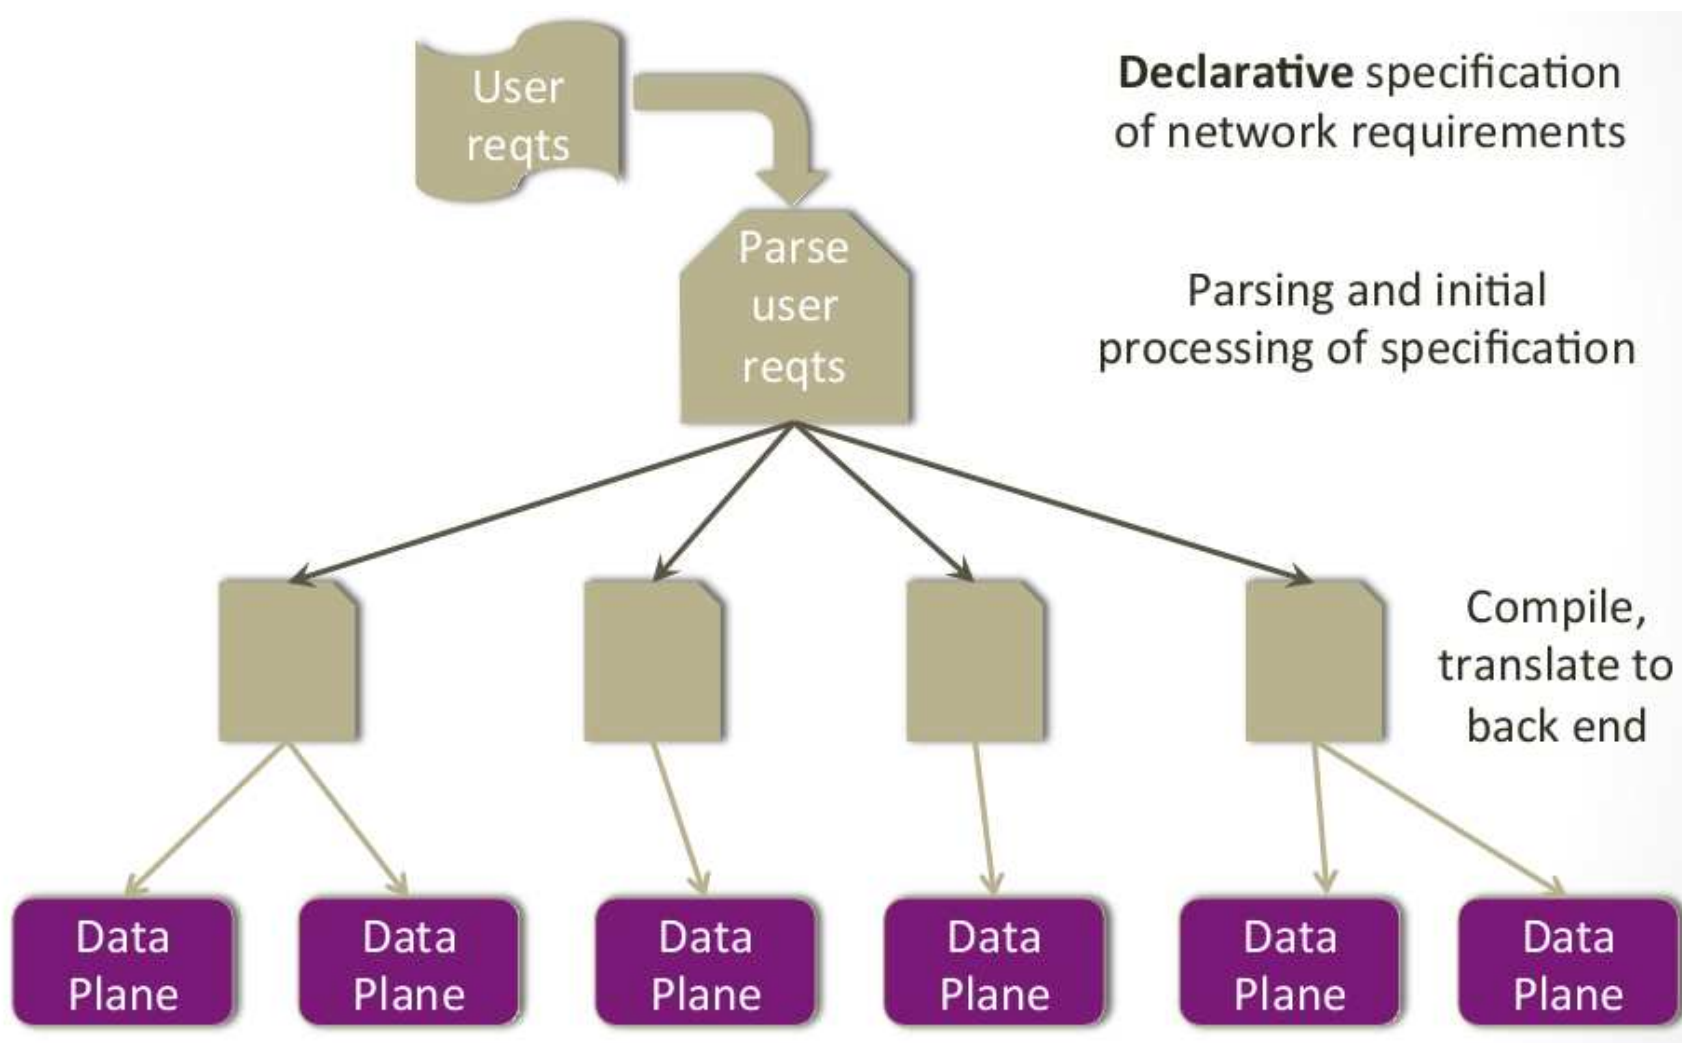

# OpenFlow Is Not the Only SDN Tool

Tool/Standard	Functionality
OpenFlow (ONF)	FIB/TCAM manipulation
NETCONF (IETF)	Configuration management
OF-Config	OpenFlow switch configuration management (YANG schema)
Internet Routing System (IRS, IETF non-WG)	Routing table interaction/manipulation

## Vendor APIs

- Cisco: Open Networking Environment (ONE), EEM (Tcl), Python scripts)
- Juniper: Junos XML API and SLAX (human-readable XSLT)
- Arista EOS: XMPP, Linux scripting (including Python and Perl)
- Dell Force10: Open Automation Framework (Perl, Python, NetBSD shell)
- F5: iRules (Tcl-based scripts)

## Model : Compiler

# Towards a SDN taxonomy

	Data plane (Elements used for traffic handling)	Controller solutions (Decoupled control plane)	Management (Extensible mgmt SW API)
L2-L4 routing	<ul style="list-style-type: none"> <li>• <b>SDN-D-PSwitch</b>: Simplified physical data plane elements without a control plane (e.g., Pica8 Pronto)</li> <li>• <b>SDN-D-VSwitch</b>: Simplified virtual data plane elements without a control plane (e.g., OpenVSwitch)</li> <li>• <b>SDN-D-Fabric</b>: Data plane elements, with inbuilt control plane, that collaborate to form a unified fabric (e.g., Pluribus server-switch)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>SDN-C-OpenFlow</b>: Control plane using the OpenFlow API (e.g., BigSwitch Floodlight)</li> <li>• <b>SDN-C-Overlay</b>: Control plane managing network overlays (e.g., Nicira NVP, PLUMgrid)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>SDN-N-Management</b>: Value-added network management software (e.g., Cyan Blue Planet, OpenStack Quantum, Cariden NS-OS)</li> </ul>
L4-L7 services	<ul style="list-style-type: none"> <li>• <b>SDN-S-Dataplane</b>: Data plane elements to process sessions (e.g., Linerate Proxy)</li> <li>• <b>SDN-S-Fabric</b>: Scale-out enforcement of L4-L7 services where dataplane and control plane are co-located (e.g., Cisco vPath)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>SDN-S-Control</b>: Decoupled control plane for enforcing policy (e.g., vArmour)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>SDN-S-Orchestrator</b>: Platform for elastic L4-L7 services (e.g., Embrane Heleos)</li> </ul>

## SDN asks (at least) three major questions

**Where the control plane resides  
“Distributed vs Centralized” ?**

**How does the Control Plane talk  
to the Data Plane ?**

**How are Control and  
Data Planes programmed ?**

## SDN asks (at least) three major questions

Where the control plane resides  
“Distributed vs Centralized” ?

- What state belongs in distributed protocols?
- What state must stay local to switches?
- What state should be centralized?
- **What are the effects of each on:**
  - state synchronization overhead
  - total control plane overhead
  - system stability and resiliency
  - efficiency in resource use
  - control loop tightness

# Control Plane Research Questions

## Distribution and Separation

- Optimality
- Resilience
- Coverage
- Visibility
  - Global versus local?
- Scale
  - horizontal,
  - data base,
  - offline path computation

## Logically Centralized?

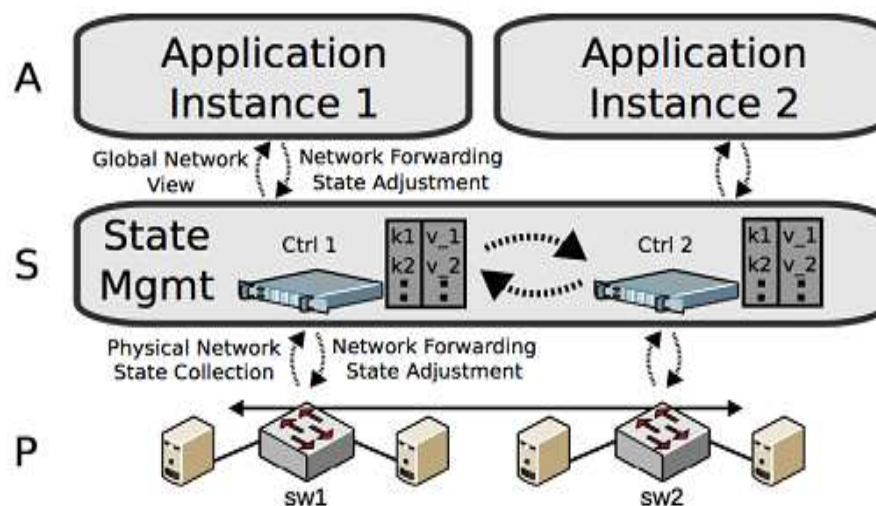

Figure 1: SDN state distribution and management conceptualized in layers: (A)pplication, (S)tate Management, (P)hysical Network

[Levit et al., HotSDN 12]

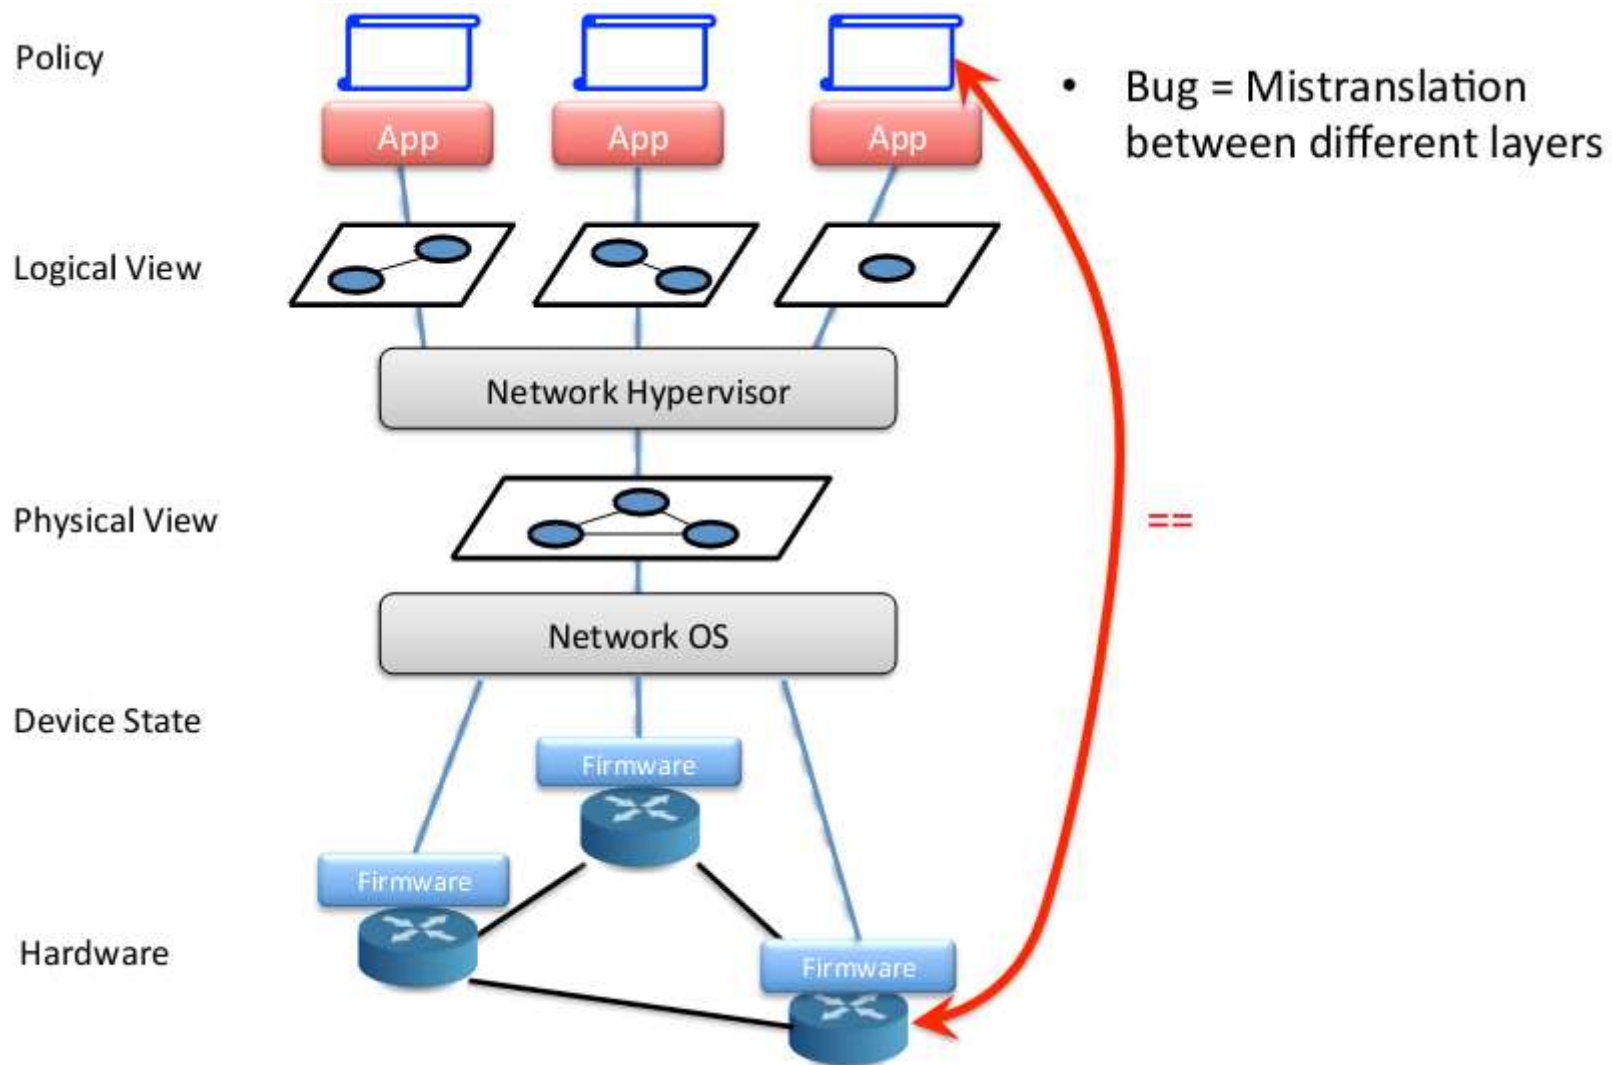

**Key Observation: Logically centralized -> Distributed System -> tradeoffs between control plane convergence and state consistency m**  
**And what about the loss of control plane/data plane fate sharing?**

## Active research topic: SDN Troubleshooting

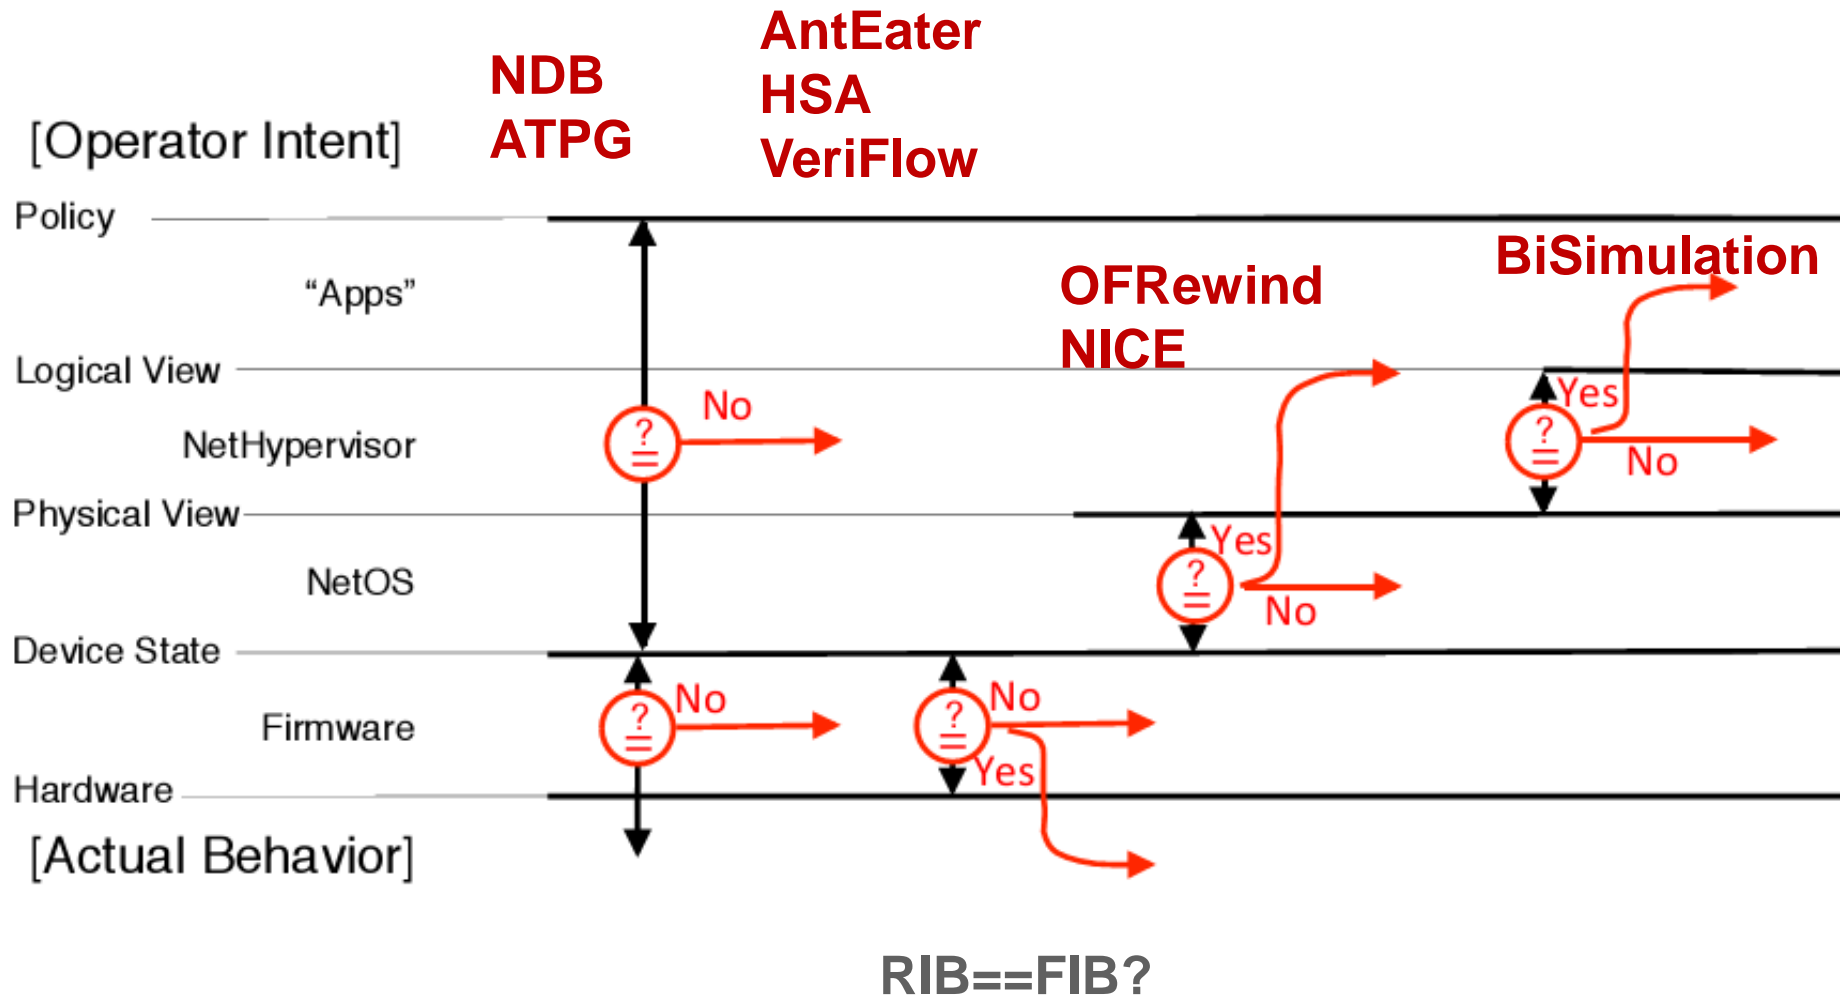

SDN provides a unique opportunity for systematic troubleshooting.

- Decouples control plane from data plane
- State changes pushed from a logically centralized location
- Easier to access/observe the state of the network
- SDN architecture provides clear abstraction for control plane functionality
- Richer troubleshooting techniques

# Bugs in SDN architectures

# Ongoing research on SDN troubleshooting

# SDN: a Fundamental Step Forward

- or just a new whip to beat vendors with?

## What makes SND attractive?

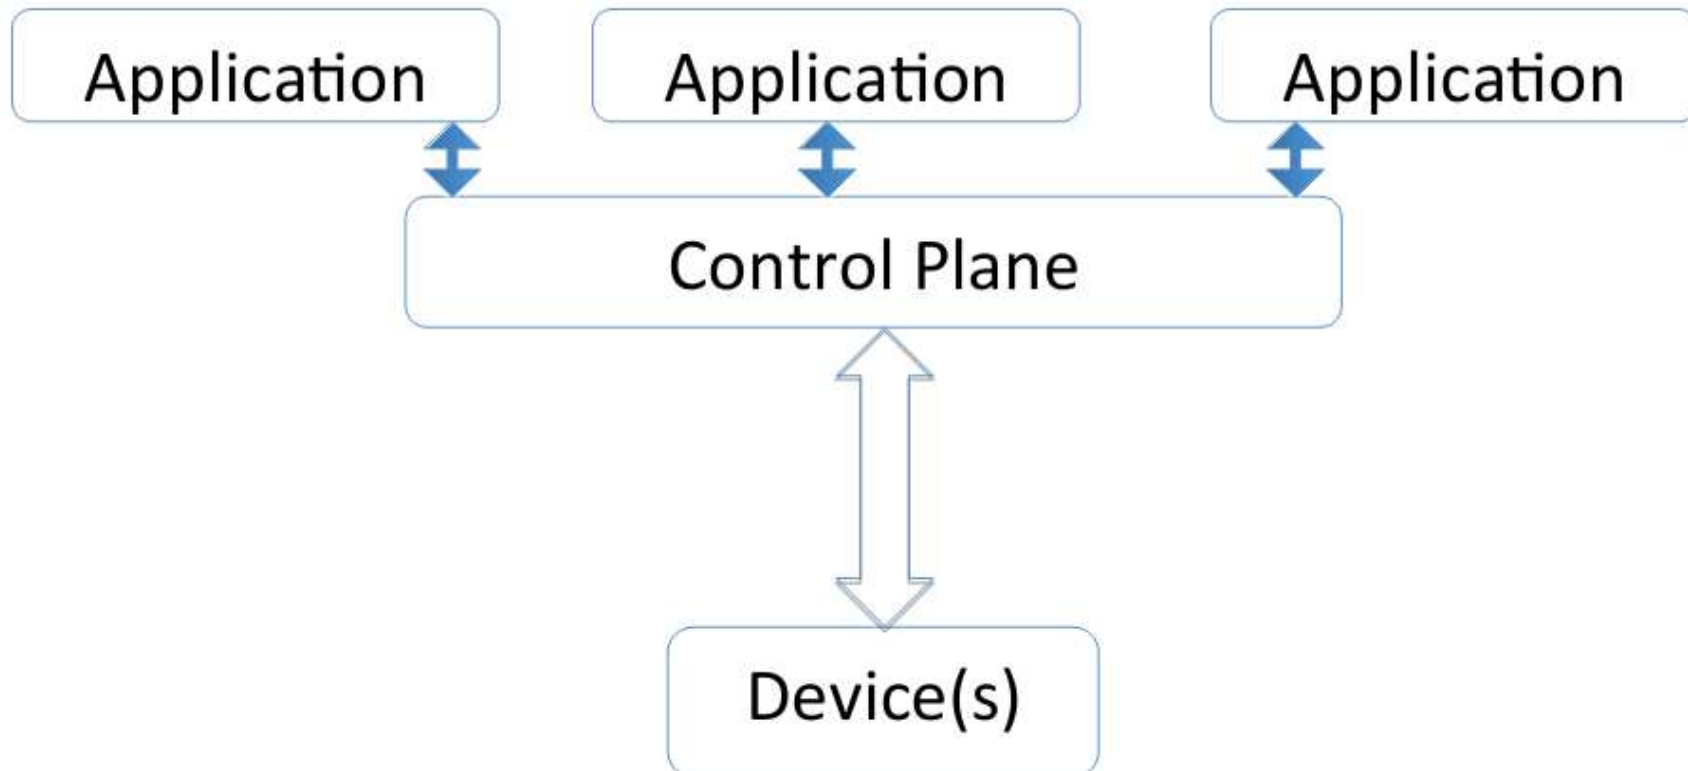

- The idea that a network is more than the sum of its parts
- I.e., take a network-wide view rather than a box-centric view
- The idea that creating network services can be a *science* rather than a set of *hacks on hacks on hacks*
- Especially hacks that vary by box, by vendor and by OS version
- The idea that there should be a *discipline* and *methodology* to service *correctness*
- Rather than testing (and more testing), declaring victory, only to fail in the real world because of some unanticipated interaction

## SDN is a real step

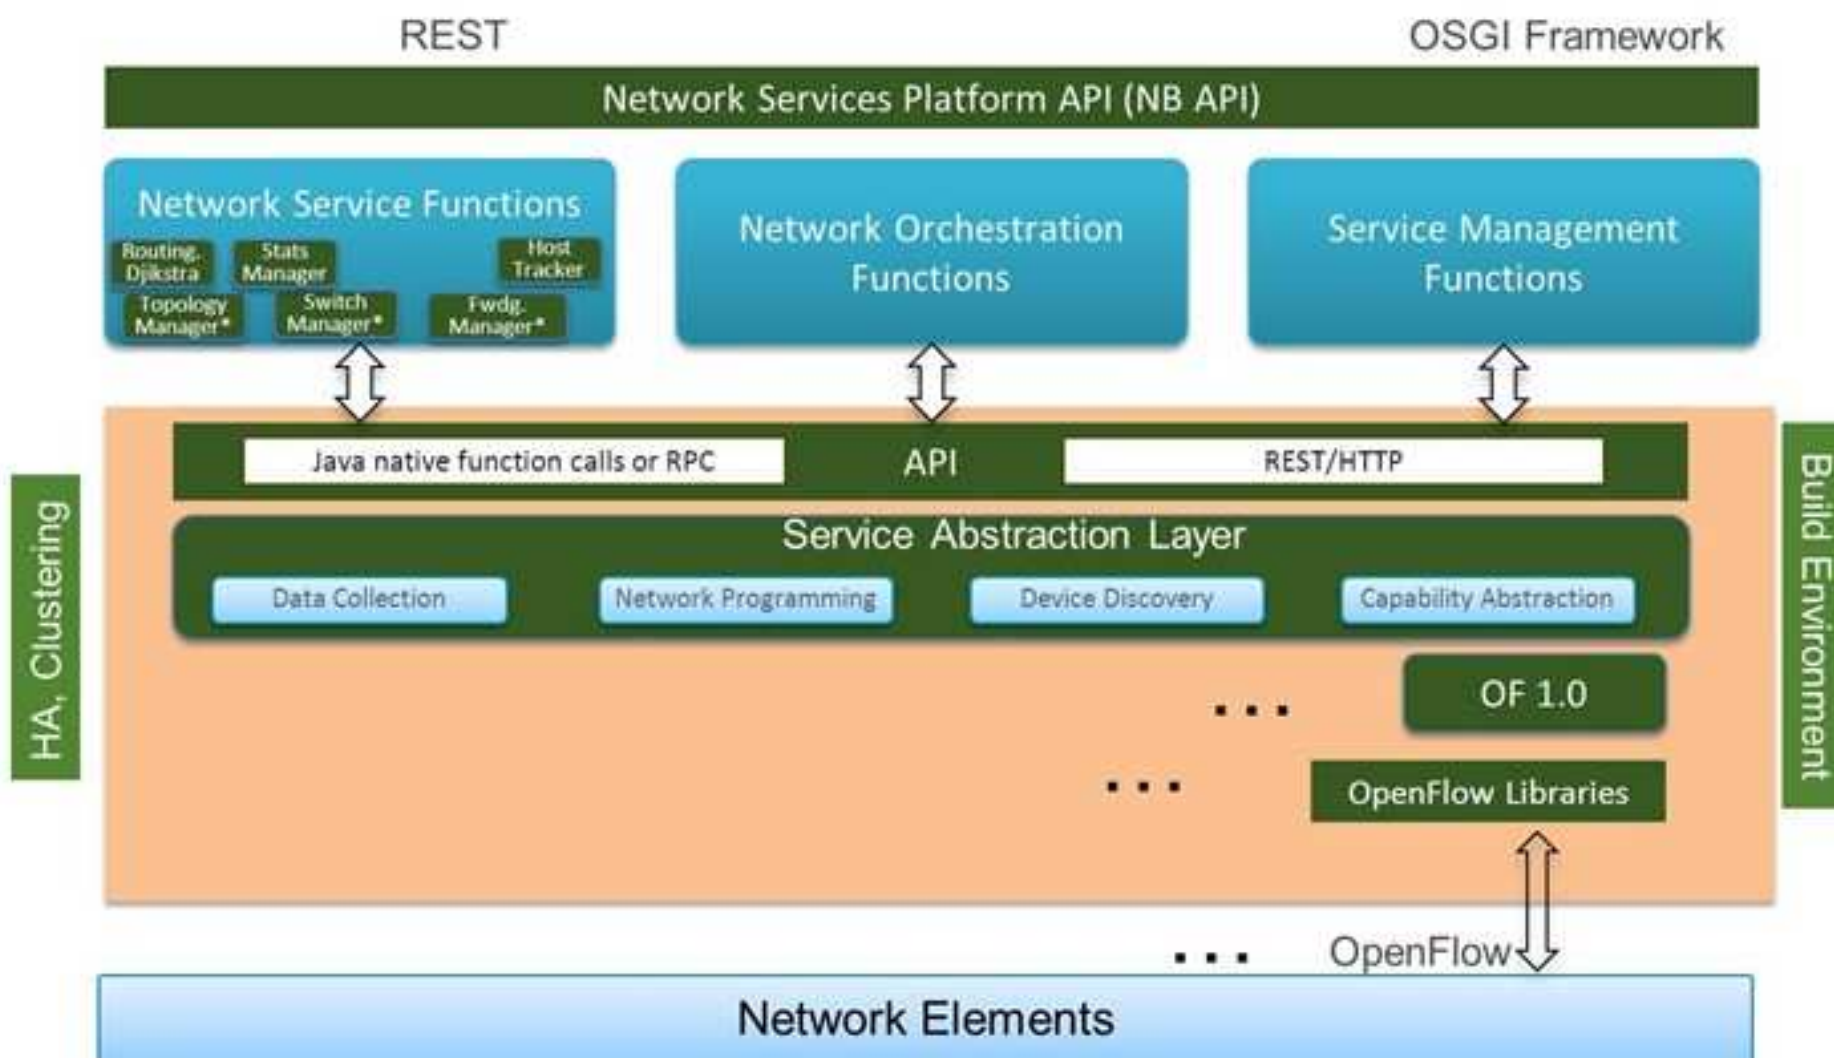

- 1. IF SDN gives us an **abstraction** of the network
- 2. IF, through this abstraction, we have a means of **reasoning** about the network and network services
- 3. IF SDN offers a means of **verifying** correct operation of the network or of a service
- 4. IF SDN offers a means of **predicting** service interaction
- 5. Finally, IF SDN offers a means of setting (conceptual) asserts by which we can get **early warning** that something is wrong

## Implementation of a SDN Control Plane

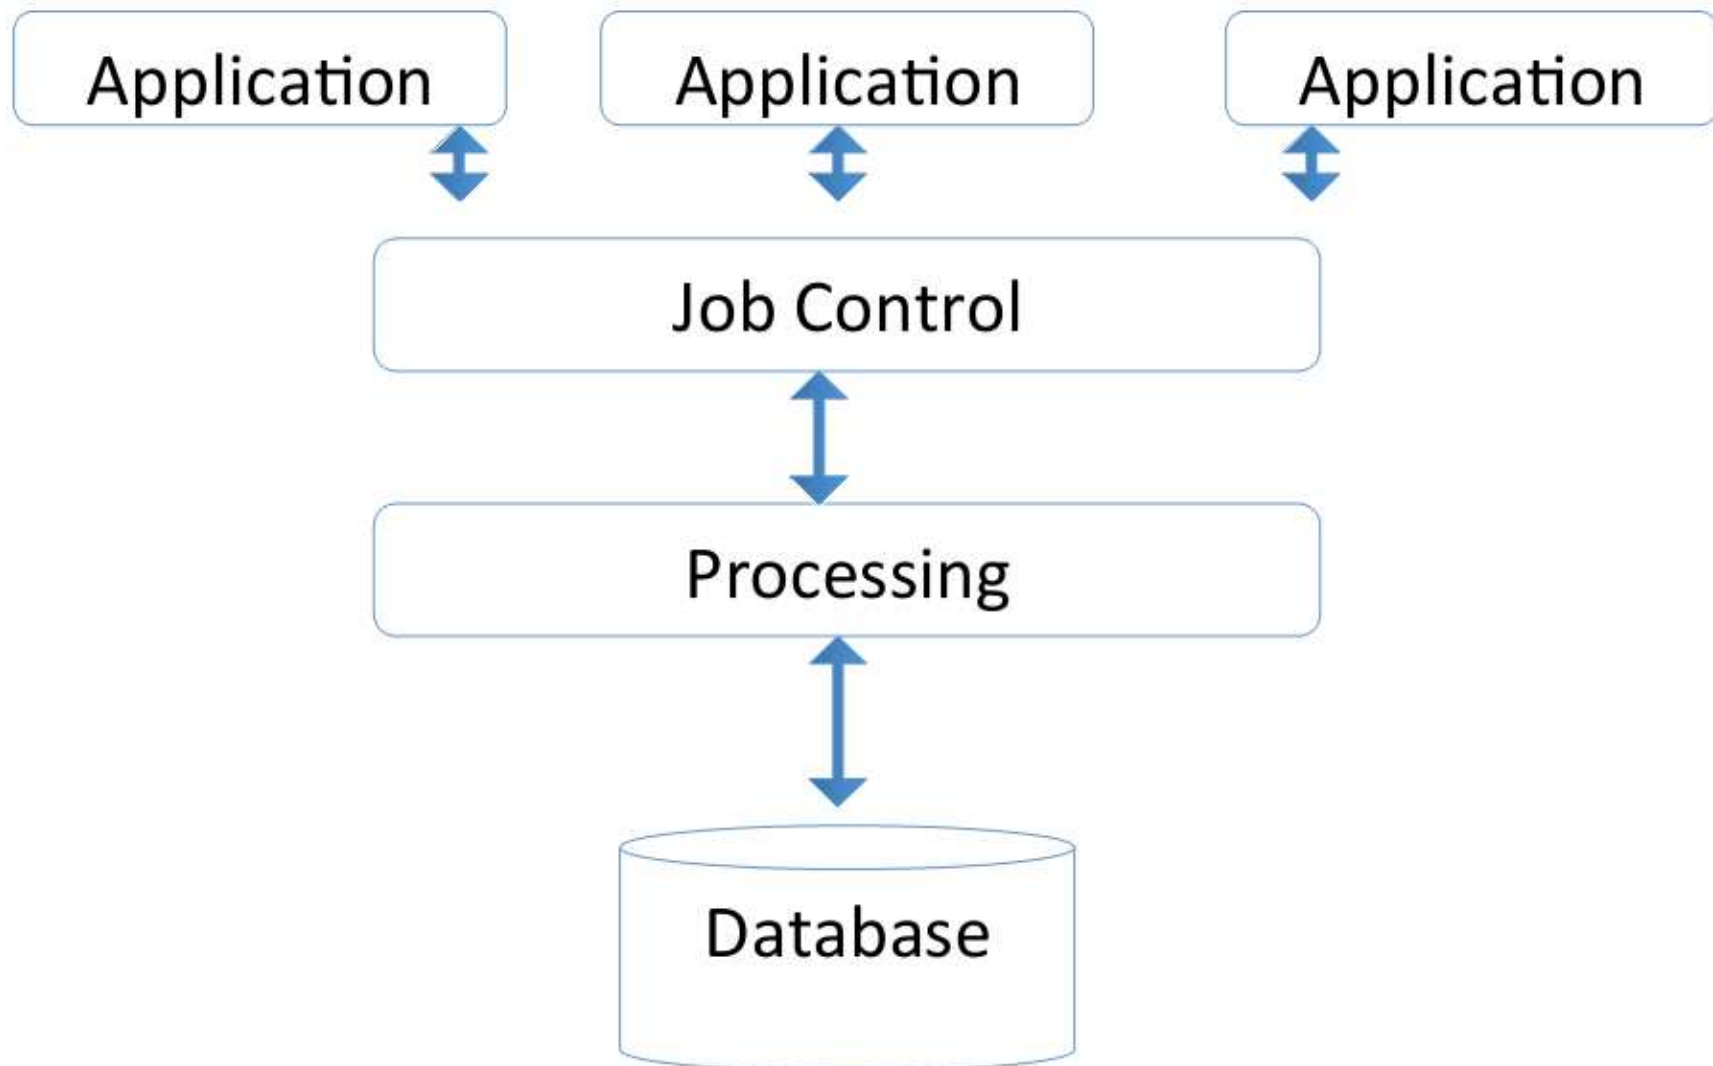

# OpenDaylight Controller Platform

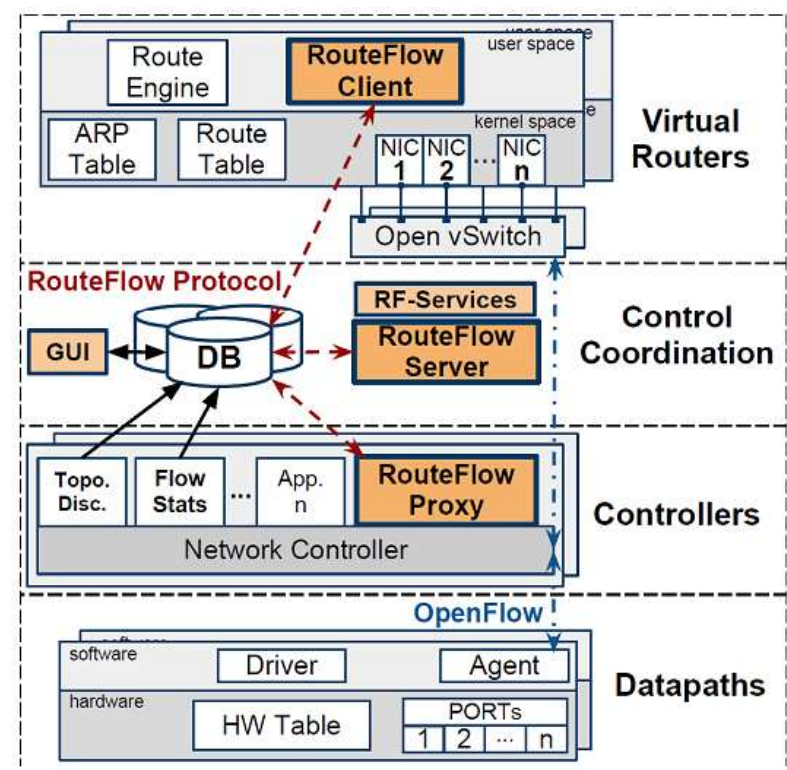

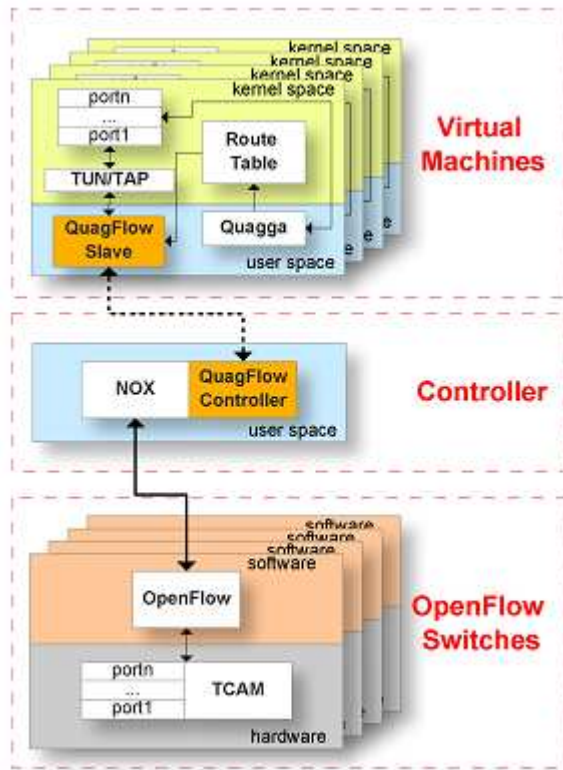

\* limited to functionality that is possible via Open Flow 1.0

## Anatomy of a Control Plane as a Modern Controller

# RouteFlow control plane architecture

Software-Defined Optical Transport

Software-Defined IP Routing

**OpenFlow 1.x prototyping**

Software-Defined Wireless Networking

Cloud Software-Defined Telecom Services

# Reflections on FIBRE research opportunities

- OpenFlow is just (but currently best) low-level tool
- FIBRE should be the *means* of SDN research not the *end*
  - Think big on the SDN research opportunities!
  - Problem- or Solution-focused research? Or solution-prompt?
  - Spiral / DevOps approach (Design-> Experiment -> Refine)?
- FIBRE and dependency on the FlowVisor virtualization layer
  - Plans to embrace OpenFlow 1.x?
  - Rethink the virtualization strategy?
- Let's work towards a network science discipline
  - Not simple SDN-washed papers

Domains of Use

Enterprise Networks

Datacenter Networks

Service Provider Networks

Cellular Networks

Home Networks

- Não existe uma disciplina de redes como existe na computação
- apenas uma cultura de protocolos de comunicações que são adicionados ou especializados a cada necessidade de nova funcionalidade ou correção, tornando as redes extremamente complexas.
- Isto explica porque até hoje não entendemos a dinâmica das redes, dos seus estados, do tráfego da Internet, porquê mal compreendemos como a Internet ainda funciona (ex: BGP ainda é um mistério).

- Cultura de remendos por meio de novos protocolos e novas funções é insustentável !!!
- Necessário definir/repensar a(s) disciplina(s) de redes

## Desafios de Pesquisa

- Entendendo Redes e as redes
- Impactos dos requisitos atuais
- Impactos dos princípios de projeto atuais
- Impactos do modelo atual
- Impactos das arquiteturas atuais
- Impactos dos protocolos atuais
- Impactos das implementações atuais

## Desafios de Pesquisa

- Repensando Redes:
  - **Requisitos**
    - Segurança, mobilidade, robustez, flexibilidade, liberdade de escolha, etc
  - **Propriedades**
    - Separação das preocupações, endereçamento lógico (nós, aplicações, objetos), recursividade, etc
  - **Arquitetura**
    - Orientação, separação dos planos de controle e encaminhamento, “end-to-end”, IPC, Overlays, Virtualização, etc
  - **Abstrações**
    - Comutação, hardware, da rede, topologia, políticas, configuração, grafos, compiladores, etc

## Desafios de Ensino

- Pesquisadores atuais foram educados na disciplina corrente:
  - Vícios dificultam outras formas de pensamento
- Professores do amanhã estão sendo educados na disciplina corrente:
  - Vícios dificultam assimilação e outras formas de ensinamento
- Necessário encontrar uma forma que capte o interesse do aluno e facilite a absorção do conhecimento
  - Teoria + Experimentação/Prototipagem (quando aplicável)

## O desafio

- compreender essas dimensões,
- entender os porquês,
- entender que as redes não são mais entidades isoladas e sim parte de um sistema maior,
- em definir princípios e requisitos,
- em conceber um modelo e abstrações que caracterizem uma rede
- que tenham expressividade suficiente para nortear e suportar avanços científicos e desenvolvimentos tecnológicos do estado da arte,
- tal como tem ocorrido de forma explosiva na computação nas últimas décadas.

- Seguem como exemplo algumas questões explicitas que o desafio poderia abordar:
- Quais são os princípios que devem nortear o projeto e operação de uma rede?
- Mesmo um dos princípios amplamente aceitos, como é o do “fim-a-fim” (Saltzer, Reed, and Clark, 1981), não é propriamente um “princípio” provável nem aplicável em todo contexto de rede, em especial sob os requisitos e objetivos das redes atuais, após mais de 3 décadas da sua formulação.

- Como conciliar os diferentes interesses conflitantes entre usuários e produtores de uma tecnologia de rede, ou seja, entre operadores ou usuários finais, e fabricantes de equipamento e desenvolvedores das soluções de software de controle?
- Um conflito semelhante acontece na operação de rede sob a óptica das múltiplas camadas. Por exemplo, considerando uma operadora de rede, as equipes da rede de “transporte” (comutação circuitos, SDH, WDM, OTN, etc.) e as equipes de “IP” (roteamento entre e intra-dominio) tem reduzida interação, existe pouca sinergia, o que resulta em operações ineficientes e custosas. Trate-se sim de um mal organizacional do empregador, mas que tem uma raiz na falta de princípios unificadores na disciplina de redes e que acaba se traduzindo numa especialização e fragmentação prejudicial para a indústria e ciência de redes como um todo.
- Analogamente, conforme discutido a seguir, existe uma

- Como reduzir o *gap* ou *separation of concerns* ainda dominante entre computação e rede?
- A especialização dos cientistas e profissionais nessas duas áreas ou domínios de atuação tem ficado evidente com o surgimento da computação em nuvem e a necessidade de se definir novas arquiteturas de datacenter que virtualizem e orquestrem o controle dinâmico dos recursos de (1) computação, (2) de armazenamento e (3) de rede de forma holística e integrada.

- Como difundir na área de redes e como aplicar os conhecimentos e soluções de software gerados na última década para problemas de sistemas distribuídos e bases de dados para contribuir ao projeto e desenvolvimento dessas novas abstrações para o plano de controle de rede?
- De novo, uma abordagem multi-disciplinar é chamada para conseguir transformar o problema de redes em uma ciência / disciplina de redes como existe na computação

## Impacto no Ensino

- A partir deste ponto, outro desafio passa a ser ensinar os alunos a pensar em redes sob esta perspectiva e não mais sob a dos protocolos.
- Faz-se necessário definir uma disciplina de redes correspondente que seja capaz de capturar o interesse dos alunos e de ser absorvida por eles.
- Esta disciplina deve ensinar princípios, abstrações e modelos de forma teórica e prática, formando alunos capazes de pensar e de produzir a inovação e de criar uma indústria pujante de redes de que o país tanto precisa.
