## How to read Capacitor Codes

Large capacitor have the value printed plainly on them, such as $10 . \mathrm{uF}$ (Ten Micro Farads) but smaller disk types along with plastic film types often have just 2 or three numbers on them?

First, most will have three numbers, but sometimes there are just two numbers. These are read as Pico-Farads. An example: 47 printed on a small disk can be assumed to be 47 Pico-Farads (or 47 puff as some like to say)

Now, what about the three numbers? It is somewhat similar to the resistor code. The first two are the $1^{\text {st }}$ and $2^{\text {nd }}$ significant digits and the third is a multiplier code. Most of the time the last digit tells you how many zeros to write after the first two digits, but the standard (EIA standard RS-198) has a couple of curves that you probably will never see. But just to be complete here it is in a table.

| Third digit | Multiplier (this times the first two <br> digits gives you the value in <br> Pico-Farads) |
| :--- | :--- |
| 0 | 1 |
| 1 | 10 |
| 2 | 100 |
| 3 | 1,000 |
| 4 | 10,000 |
| 5 | 100,000 |
| 6 not used |  |
| 7 not used |  |
| 8 | .01 |
| 9 | .1 |

Now for an example: A capacitor marked 104 is 10 with 4 more zeros or $100,000 \mathrm{pF}$ which is otherwise referred to as a 1 uF capacitor.

Most kit builders don't need to go further, but I know you want to learn more. Anyway, Just to confuse you some more there is sometimes a tolerance code given by a single letter. I don't know why there were picked in the order they are, except that it kind of follows the middle row of keys on a typewriter.

So a 103J is a $10,000 \mathrm{pF}$ with $+/-5 \%$ tolerance

| Letter symbol | Tolerance of capacitor |
| :--- | :--- |
| D | $+/-0.5 \mathrm{pF}$ |
| F | $+/-1 \%$ |
| G | $+/-2 \%$ |
| H | $+/-3 \%$ |
| $J$ | $+/-5 \%$ |
| $K$ | $+/-10 \%$ |
| M | $+/-20 \%$ |
| P | $+100 \%,-0 \%$ |
| $Z$ | $+80 \%,-20 \%$ |
