Outline

Introduction

VBaaS

Use Cases

Related Work

Conclusion

INTRODUCTION

Motivation

VNFs and performance metrics

NFV Performance and portability requirements

- Customers Key Quality Indicators (KQIs)
- Dynamic workloads, infrastructure failures, etc
- Service Assurance/Continuity (IT – Telco)

DevOps

- * Repeatable and reliable processes
- * Modular applications in production-like systems
- * Monitor and validate operational quality of services
(after and before deployment)

VNF Benchmark-as-a-Service (VBaaS) Fundamentals

Assist orchestration manager (e.g., NFVO) decisions

On-demand test-before-deploy Capacity Planning

- = Customized performance assessments
- = Migration, scaling and auditing VNF-FGs

Conformance testing Compliance and Auditing

- = VNF continuous integration
- = Proactive policy enforcement in infrastructure setups

VBAAS

Proposal

Sweet spot between continuous monitoring vs. static view

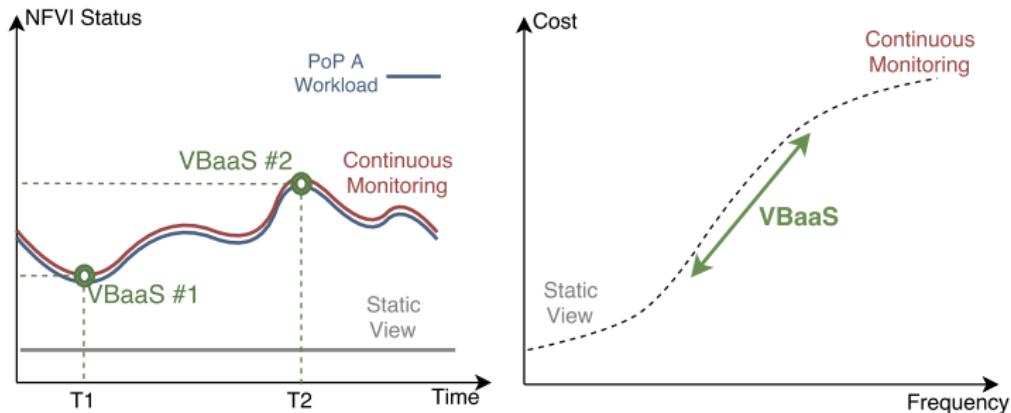

Figure: VBaaS motivation points: static view (VBaaS) continuous monitoring

General Aspects

- Why VBaaS?
 - NFV performance reliability (KQIs) and agility (Service Assurance)
- What is VBaaS?
 - VNF/NFVI features (performance) extraction framework
- How VBaaS can be performed?
 - Independently, oriented by orchestration managers requests
- When VBaaS can be used?
 - Whenever costs and time scales favour its associated costs (policies)

Components

Actors and Interfaces

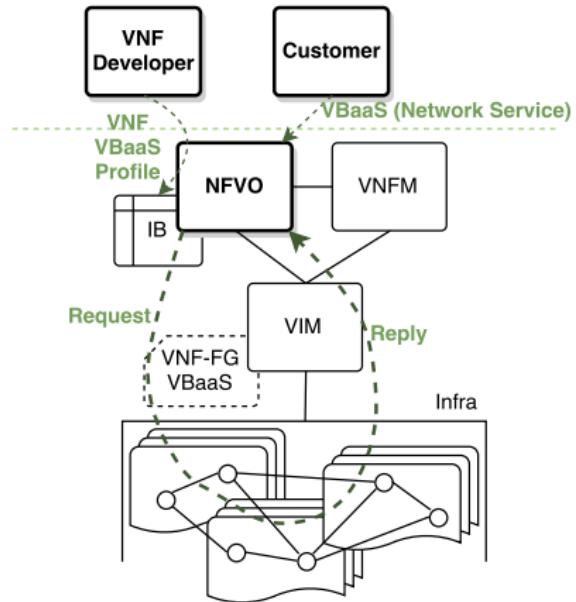

Figure: VBaaS Main Design: Components and Interfaces

Components

VBaaS - Information Base

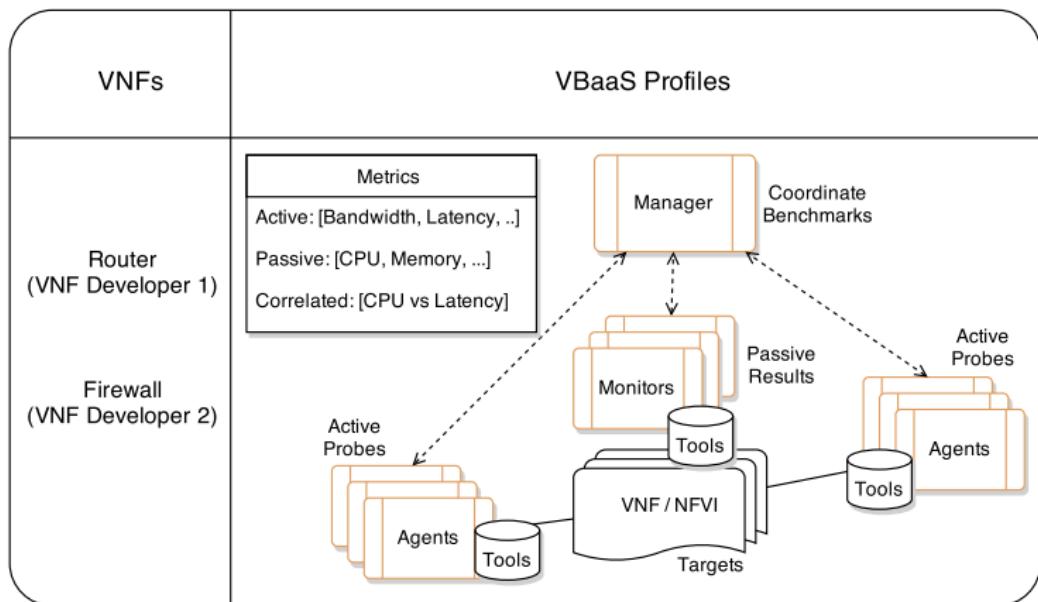

Figure: VBaaS Information Base and VNF Benchmark Profile

USE CASES

VBaas Workflows

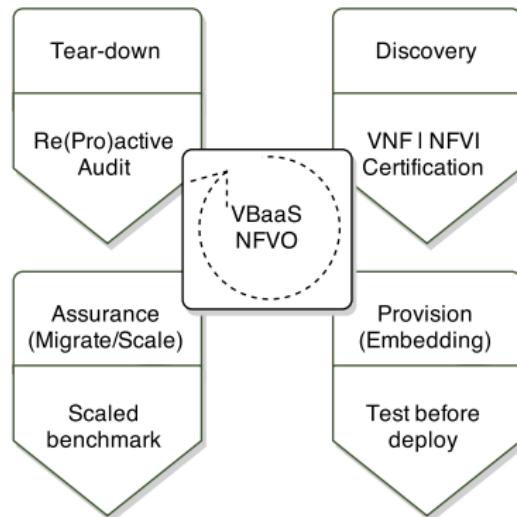

Figure: VBaas lifecycle

Use Case: Provision

Test-before-deploy

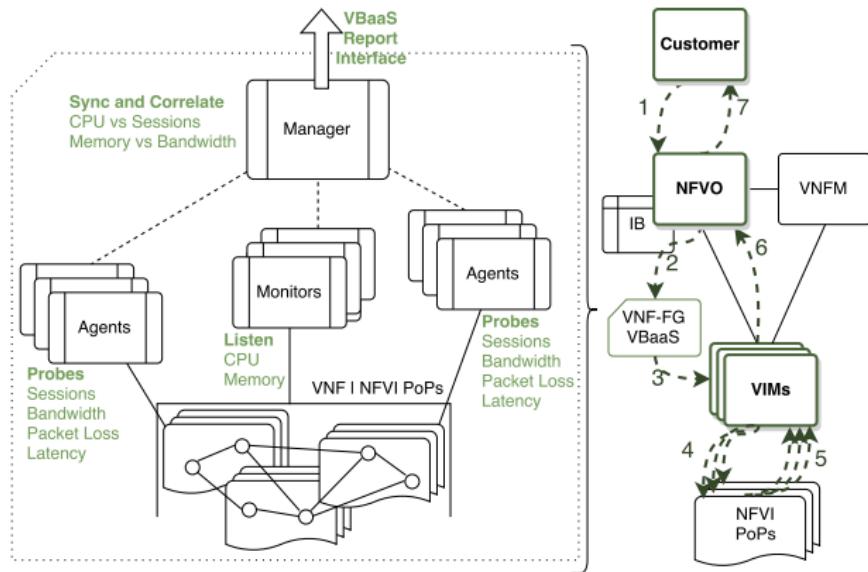

Figure: VBaas provision workflow

Use Cases Comparison

Table: VBaaS Applicability

Workflow	Objective
Discovery	Compliance
Provision	Test-before-deploy
Assurance	Service continuity
Tear-down	Audit

VBaaS Details

VNF and NFVI PoPs performance profiles

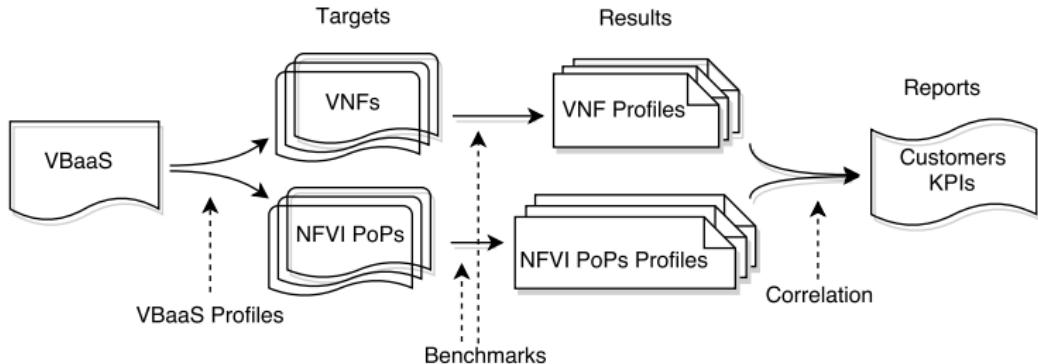

Figure: Correlation of VBaaS results

VBaas Details

Profiles Results

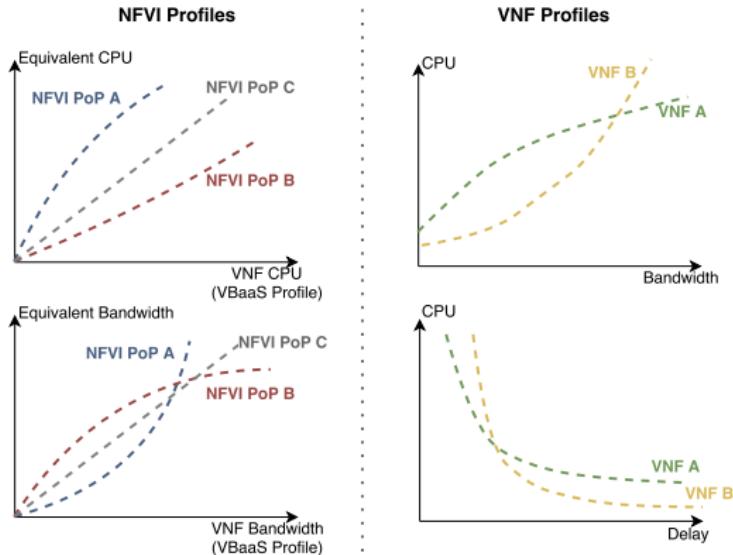

Figure: Assumptions of VBaas reports

Analysis Considerations

1. When NFVI PoPs or VNFs are in certain % of utilization
2. Noisy behaviour
3. Long-term tests
4. Constant flux
5. Recovery exam of failed VNF/NFVI
6. Shared resources, comparison with non-virtualized, metrics dependence, etc

RELATED WORK

Projects

- T-NOVA
- Trilogy
- Unify

Open Source

- OPNFV: Yardstick and vSwitchPerf

CONCLUSION

Summary

"Trust, but verify", maybe better: *verify, then trust*

VBaaS

- Motivation: NFV performance reliability/agility and DevOps
- Certification of performance profiles for VNFs and NFVI PoPs
- Instrumentation before VNF-FGs deployment (fine-tune decisions)
- VBaaS processes: discovery, provision, maintenance, tear-down
- Benchmark Considerations!

Future Work

- * NFVO decision process for NFVI PoP targets selection
- * Benchmark dependencies and consistent tasks
- * Correlation of VBaaS results
- * Prototyping in Unify architecture
- * Input for Multi Domain Distributed NFV
