Fuzzy Sets*

L. A. ZADEH

Department of Electrical Engineering and Electronics Research Laboratory, University of California, Berkeley, California

A fuzzy set is a class of objects with a continuum of grades of membership. Such a set is characterized by a membership (characteristic) function which assigns to each object a grade of membership ranging between zero and one. The notions of inclusion, union, intersection, complement, relation, convexity, etc., are extended to such sets, and various properties of these notions in the context of fuzzy sets are established. In particular, a separation theorem for convex fuzzy sets is proved without requiring that the fuzzy sets be disjoint.

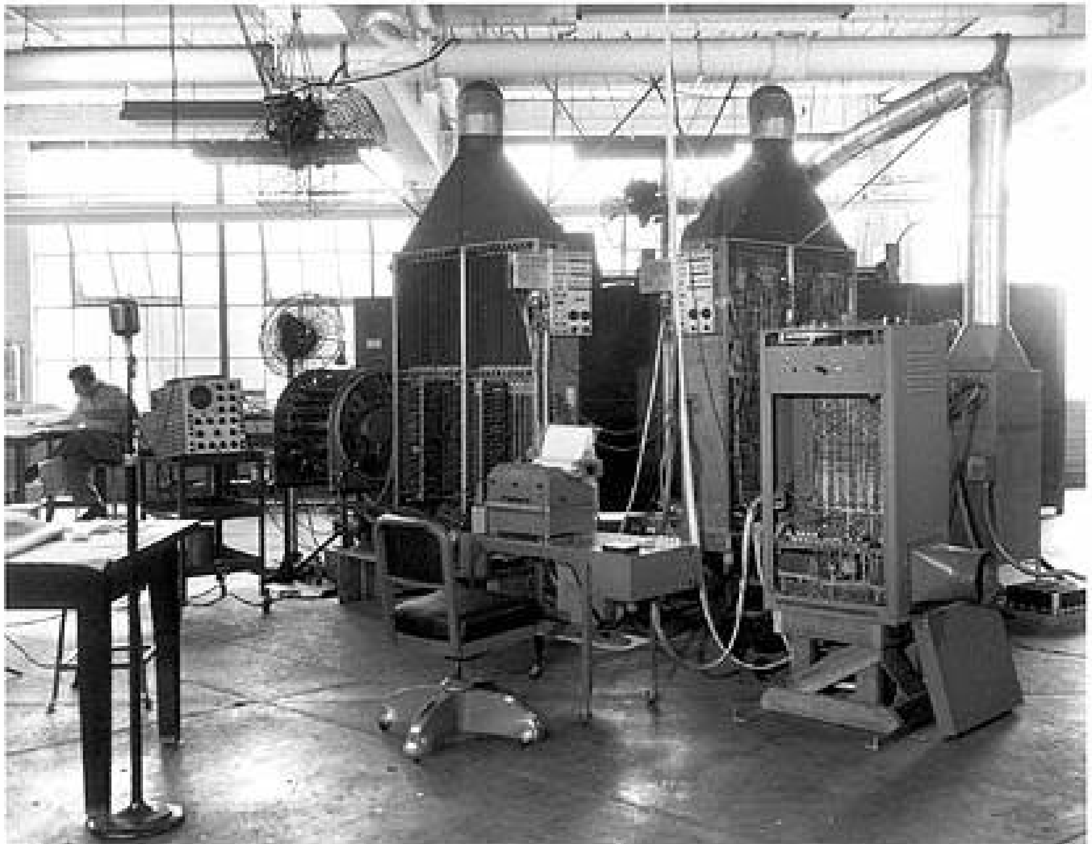
UNIVAC (Universal Automatic Computer)

Plate 20. UNIVAC digital computer in the U.S.A., showing a bank of magnetic-tape storage units on the right

BINAC (Binary Automatic Computer)

BINAC was an early electronic computer designed for *Northorp Aircraft Company* by Eckert and Mauchly in 1949.



The BINAC was a bit-serial binary computer with two independent CPUs, each with its own 512-word acoustic mercury delay line memory. The CPUs continously compared results to check for errors caused by hardware failures. The 512-word acoustic mercury delay line memories were divided into 16 channels each holding 32 ords (31-bit with an additional 11-bit space between words to allow for circuit delays in switching. The clock rate was 4.25 MHz which yielded a word time of about 10 microseconds. New programs or data had to be entered manually in octal using an eight-key keypad.

The New York Academy of Sciences (1952)
Series II, Vol. 14, No. 5, pp. 201-204.

Problem:

Let $X = \{x(t)\}$ be a set of signals.
An arbitrarily selected member of this set, say $x(t)$,
is transmitted through a noisy channel G
and is received as $y(t)$.

As a result of the noise and distortion introduced by G, the received signal $y(t)$ is, in general, quite different from $x(t)$.

Nevertheless, under certain conditions it is possible to recover $x(t)$ – or rather a time-delayed replica of it – from the received signal $y(t)$.

$y = G\,x$ ***resp.*** $x = G^{-1}\,y$

Lotfi Zadeh, 1952: *Some Basic Problems in Communication of Information*

The New York Academy of Sciences (1952)
Series II, Vol. 14, No. 5, pp. 201-204.

Special case: *reception process*:

Let $X = \{x(t)\}$ consist of a finite number of discrete signals $x_1(t)$, $x_2(t)$, …, $x_n(t)$, which play the roles of symbols or sequences of symbols.

The replicas of all these signals are assumed to be available at the receiving end of the system. Suppose that a transmitted signal x_k is received as y.

To recover the transmitted signal from y, the receiver evaluates the ‘distance’ between y and all possible transmitted signals x_1, x_2, …, x_n, by the use of a suitable distance function $d(x, y)$, and then selects that signal which is ‘nearest’ to y in terms of this distance function.

The New York Academy of Sciences (1952)
Series II, Vol. 14, No. 5, pp. 201-204.

Distance functions:

- $d(x, y) = \text{l.u.b.}\ |x(t) - y(t)|$
- $d(x, y) = \{1/T \int_0^T [x(t) - y(t)]^2\, dt\}^{1/2}$
- $d(x, y) = \text{l.u.b.}\ \{1/T_0 \int_0^{t+T} [x(t) - y(t)]^2\, dt\}^{1/2}$
- $d(x, y) = 1/T \int_0^T |x(t) - y(t)|\, dt$

Lotfi Zadeh, 1952: *Some Basic Problems in Communication of Information*

The New York Academy of Sciences (1952)
Series II, Vol. 14, No. 5, pp. 201-204.

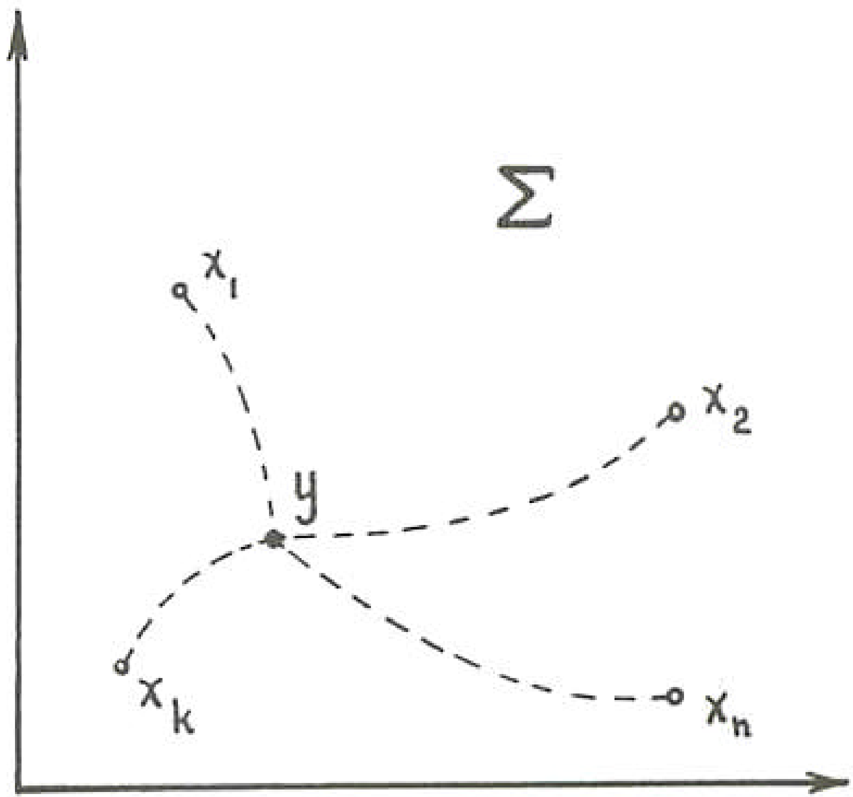

FIGURE 1. Recovery of the input signal by means of a comparison of the distances between the received signal y and all possible transmitted signals.

$d(x_k, y) < d(x_i, y)$ $i \neq k$, for all k and i.

?In many practical situations it is inconvenient, or even impossible, to define a quantitative measure, such as a distance function, of the disparity between two signals.

In such cases we may use instead the concept of neighorhood, which is basic to the theory of topological spaces.’

Lotfi Zadeh, 1952: *Some Basic Problems in Communication of Information*

The New York Academy of Sciences (1952)
Series II, Vol. 14, No. 5, pp. 201-204.

Problem: multiplex transmission of two or more signals; the system has two channels.

$X = \{x(t)\}$ and $Y = \{y(t)\}$: sets af signals assigned to their respective channels.

At the receiving end: sum signal: $u(t) = x(t) + y(t)$.

To do: Extract $x(t)$ and $y(t)$ from $u(t)$!

That means: Find two filters N_1 and N_2 such, that, for any x in X and any y in Y,

$N_1 (x + y) = x$ and $N_2(x + y) = y$

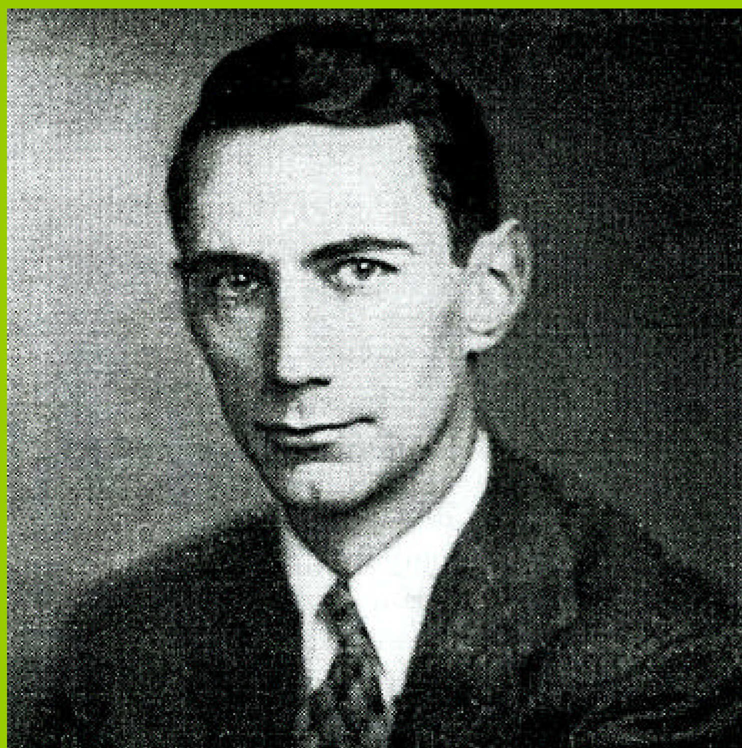
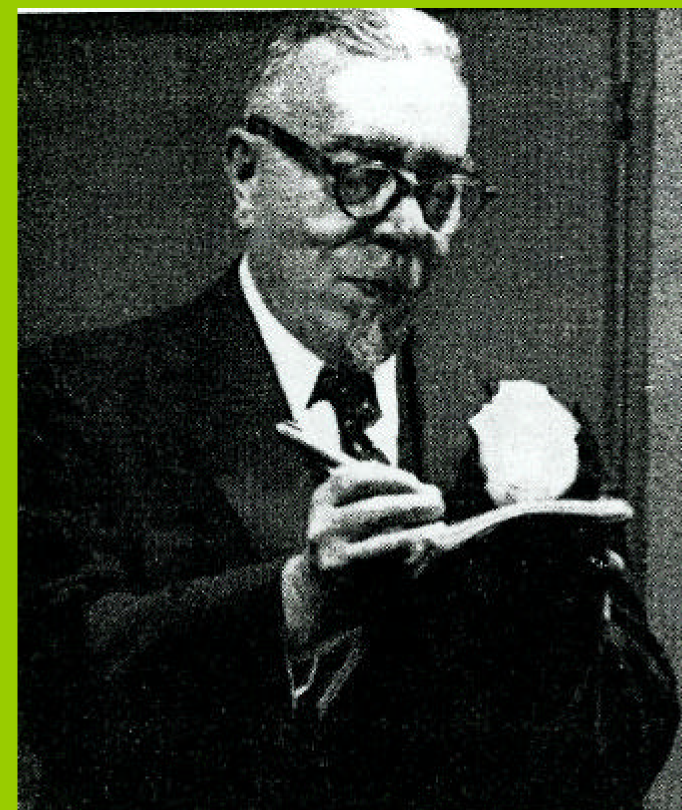
The Bandwagon



CLAUDE E. SHANNON

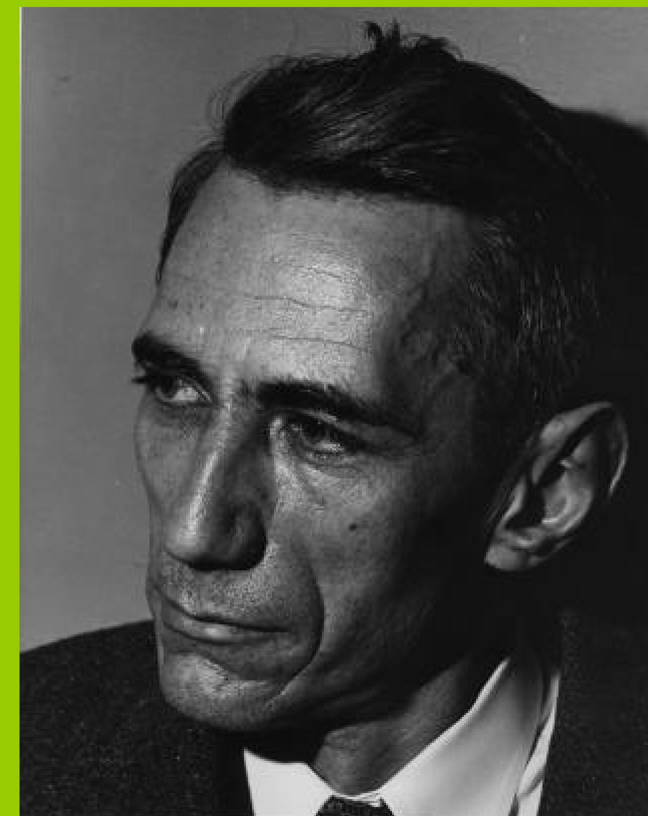
What is Information Theory?



NORBERT WIENER

C. E. Shannon: The Bandwagon, *IRE Transactions on Information Theory*, March 1956

Indeed, the hard core of information theory is, essentially, a branch of mathematics, a strictly deductive system.



Research rather than exposition is the keynote, and our critical thresholds should be raised.

N. Wiener: What is Information Theory? *IRE Trans. on Information Theory*, June 1956

I am pleading in this editorial that Information Theory go back of its slogans and return to the point of view from which it originated: that of the general statistical concept of communication.

I hope that these Transactions may encourage this integrated view of communication theory by extending its hospitality to papers which, why they bear on communication theory, cross its boundaries, and have a scope covering the related statistical theories. In my opinion we are in a dangerous age of overspecialization.

Richard Bellman, Robert Kalaba, 1957:
On the Role of Dynamic Programming in Statistical Communication Theory

R. BELLMAN

R. KALABA

In mathematical terms, let

x = the pure signal emanating from S.
r = the noise associated with the signal.
$x' = F(x, r)$, the input to the communication system.
y = the signal transmitted to the observer by the communication channel. (1)

Let us further write

$$y = T(x') = T(F(x, r)), \quad (2)$$

What Is Optimal?

L. A. Zadeh, 1962: From Cercuit Theory to System Theory

In: *Proceedings of the IRE*, May 1962, pp. 856-865.

In fact, there is a fairly wide gap between what might be regarded as „animate“ system theorists and „inanimate“ system theorists at the present time, and it is not at all certain that this gap will be narrowed, much less closed, in the near future.

There are some who feel that this gap reflects the fundamental inadequacy of the conventional mathematics – the mathematics of precisely-defined points, functions, sets, probability measures, etc. - for coping with the analysis of biological systems, and that to deal effectively with such systems, which are generally orders of magnitude more complex than man-made systems, we need a radically different kind of mathematics, the mathematics of fuzzy or cloudy quantities which are not describable in terms of probability distributions. Indeed, the need for such mathematics is becoming increasingly apparent even in the realm of inanimate systems, for in most practical cases the *a priori* data as well as the criteria by which the performance of a man-made system is judged are far from being precisely specified or having accurately-known probability distributions.

FUZZY SETS AND SYSTEMS*

L. A. Zadeh
Department of Electrical Engineering, University of California, Berkeley, California

The notion of fuzziness as defined in this paper relates to situations in which the source of imprecision is not a random variable or a stochastic process, but rather a class or classes which do not possess sharply defined boundaries, e.g., the "class of bald men," or the "class of numbers which are much greater than 10," or the "class of adaptive systems," etc.

A basic concept which makes it possible to treat fuzziness in a quantitative manner is that of a fuzzy set, that is, a class in which there may be grades of membership intermediate between full membership and non-membership. Thus, a fuzzy set is characterized by a membership function which assigns to each object its grade of membership (a number lying between 0 and 1) in the fuzzy set.

After a review of some of the relevant properties of fuzzy sets, the notions of a fuzzy system and a fuzzy class of systems are introduced and briefly analyzed. The paper closes with a section dealing with optimization under fuzzy constraints in which an approach to problems of this type is briefly sketched.

$$s_{t+1} = f(s_t, u_t),$$

$$y_t = g(s_t, u_t)$$

$$t = 0, 1, 2, \ldots$$

S **is a fuzzy system if** ***u(t)*** **or** ***y(t)*** ***or*** ***s(t)*** **or any combination are fuzzy sets.**

Lotfi A. Zadeh, 1965: Fuzzy Sets

INFORMATION AND CONTROL 8, 338–353 (1965)

Fuzzy Sets*

L. A. ZADEH

Department of Electrical Engineering and Electronics Research Laboratory, University of California, Berkeley, California

A fuzzy set is a class of objects with a continuum of grades of membership. Such a set is characterized by a membership (characteristic) function which assigns to each object a grade of membership ranging between zero and one. The notions of inclusion, union, intersection, complement, relation, convexity, etc., are extended to such sets, and various properties of these notions in the context of fuzzy sets are established. In particular, a separation theorem for convex fuzzy sets is proved without requiring that the fuzzy sets be disjoint.

I. INTRODUCTION

More often than not, the classes of objects encountered in the real physical world do not have precisely defined criteria of membership. For example, the class of animals clearly includes dogs, horses, birds, etc. as its members, and clearly excludes such objects as rocks, fluids, plants, etc. However, such objects as starfish, bacteria, etc. have an ambiguous status with respect to the class of animals. The same kind of ambiguity arises in the case of a number such as 10 in relation to the "class" of all real numbers which are much greater than 1.

Clearly, the "class of all real numbers which are much greater than 1," or "the class of beautiful women," or "the class of tall men," do not constitute classes or sets in the usual mathematical sense of these terms. Yet, the fact remains that such imprecisely defined "classes" play an important role in human thinking, particularly in the domains of pattern recognition, communication of information, and abstraction.

The purpose of this note is to explore in a preliminary way some of the basic properties and implications of a concept which may be of use in

Georg Cantor, 1895/97: Set Theory

Georg Cantor
(1845-1918):

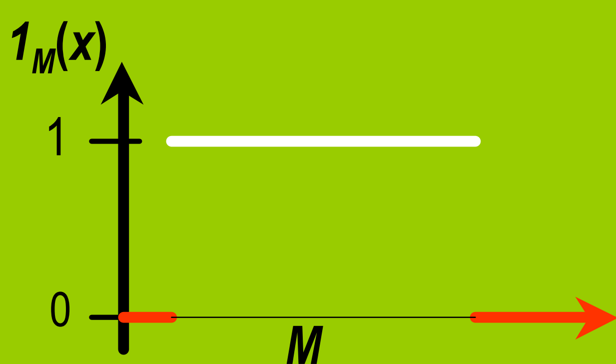
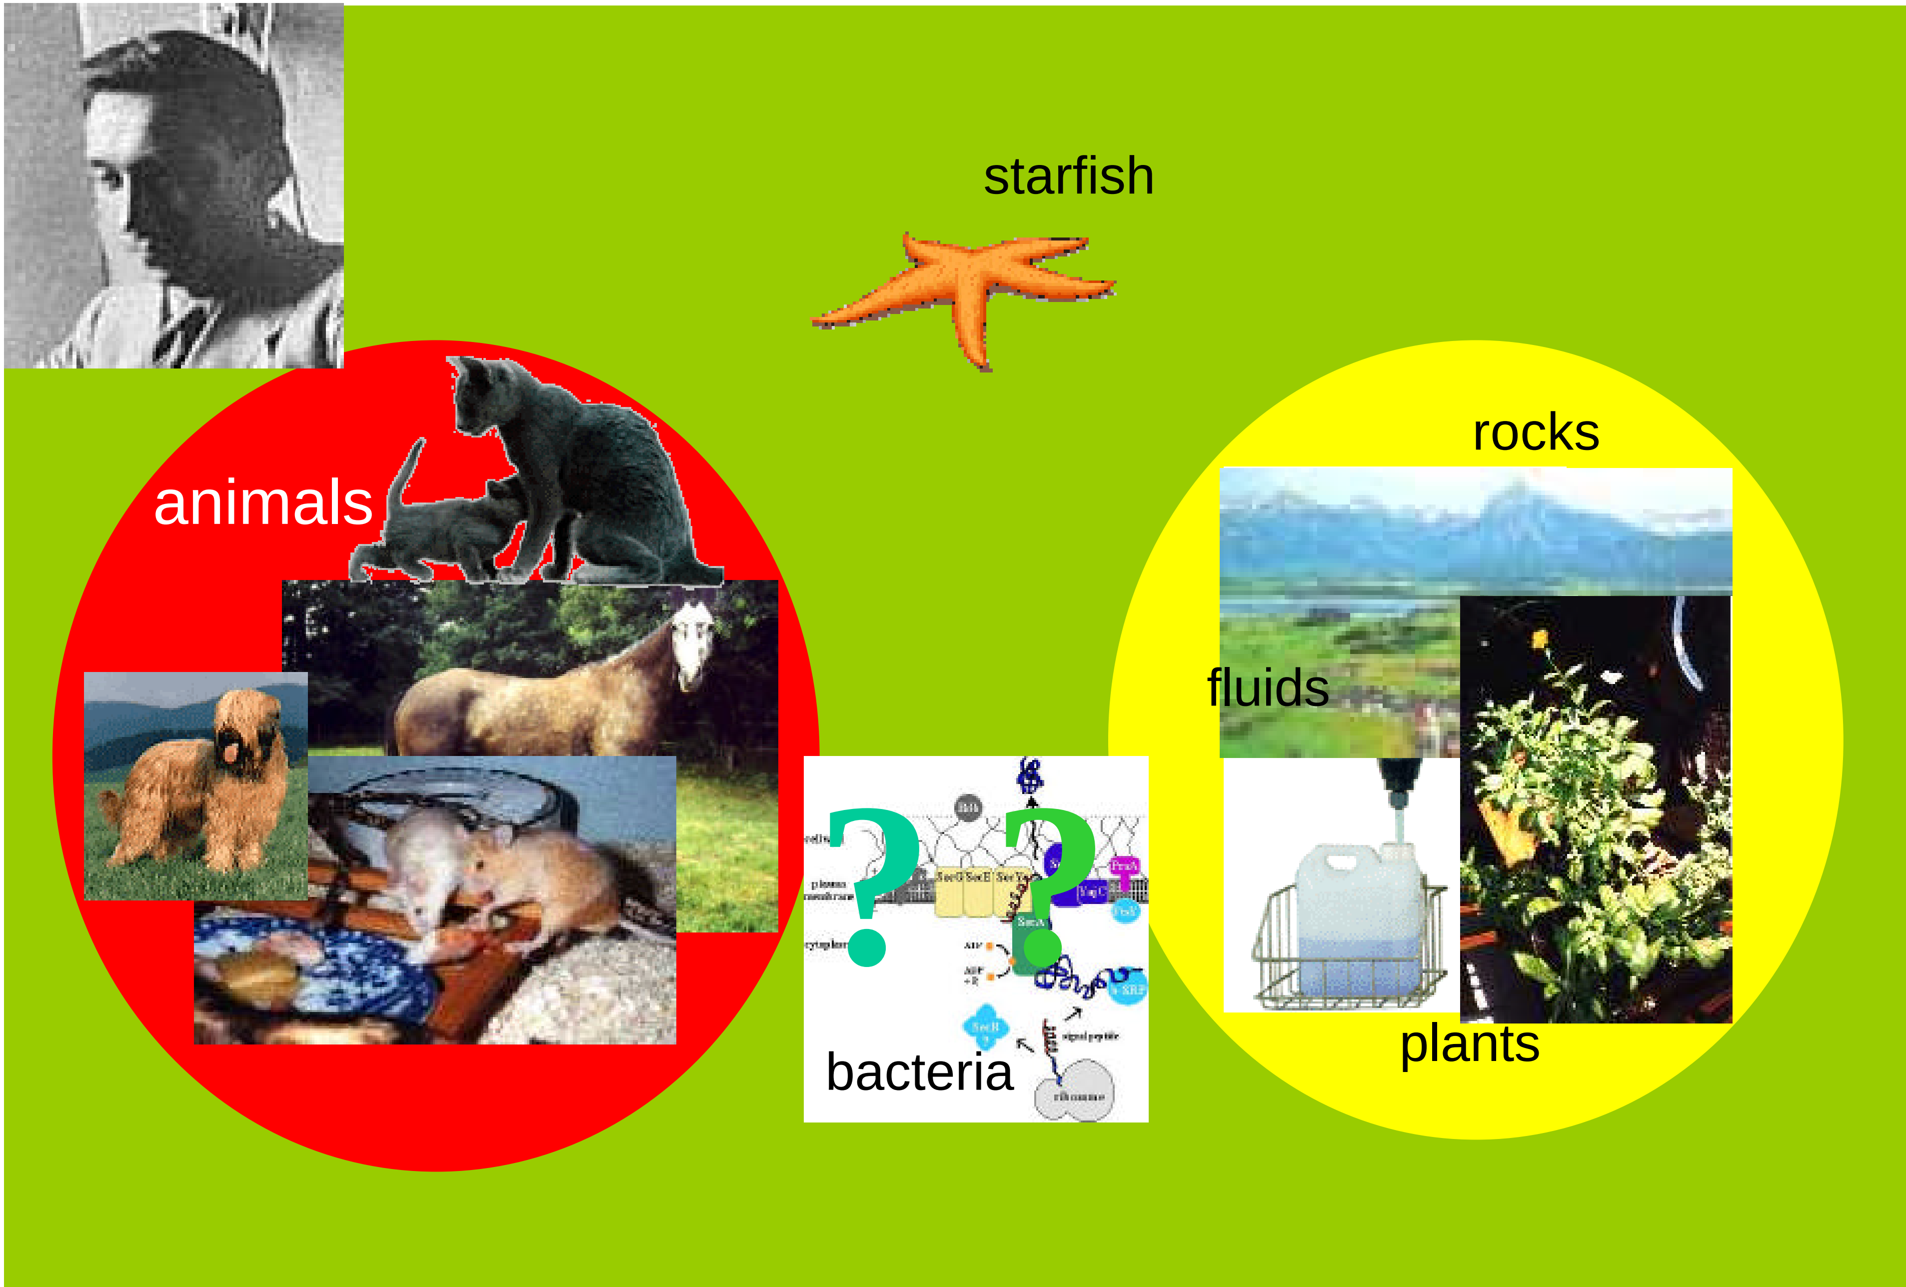
Definition:

‘A set is a collection into a whole *M* of definite and separate objects *m* of our intuition or thought.’

„Unter einer Menge verstehen wir jede Zusammenfassung *M* von bestimmten, wohlunterschiedenen Objekten *m* unserer Anschauung oder unseres Denkens (welche die Elemente von *M* genannt werden) zu einem Ganzen.“



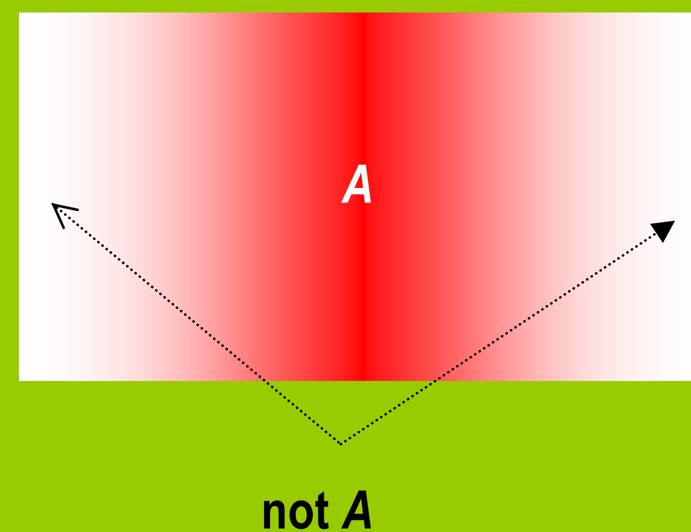
Lotfi A. Zadeh, 1965: Fuzzy Sets



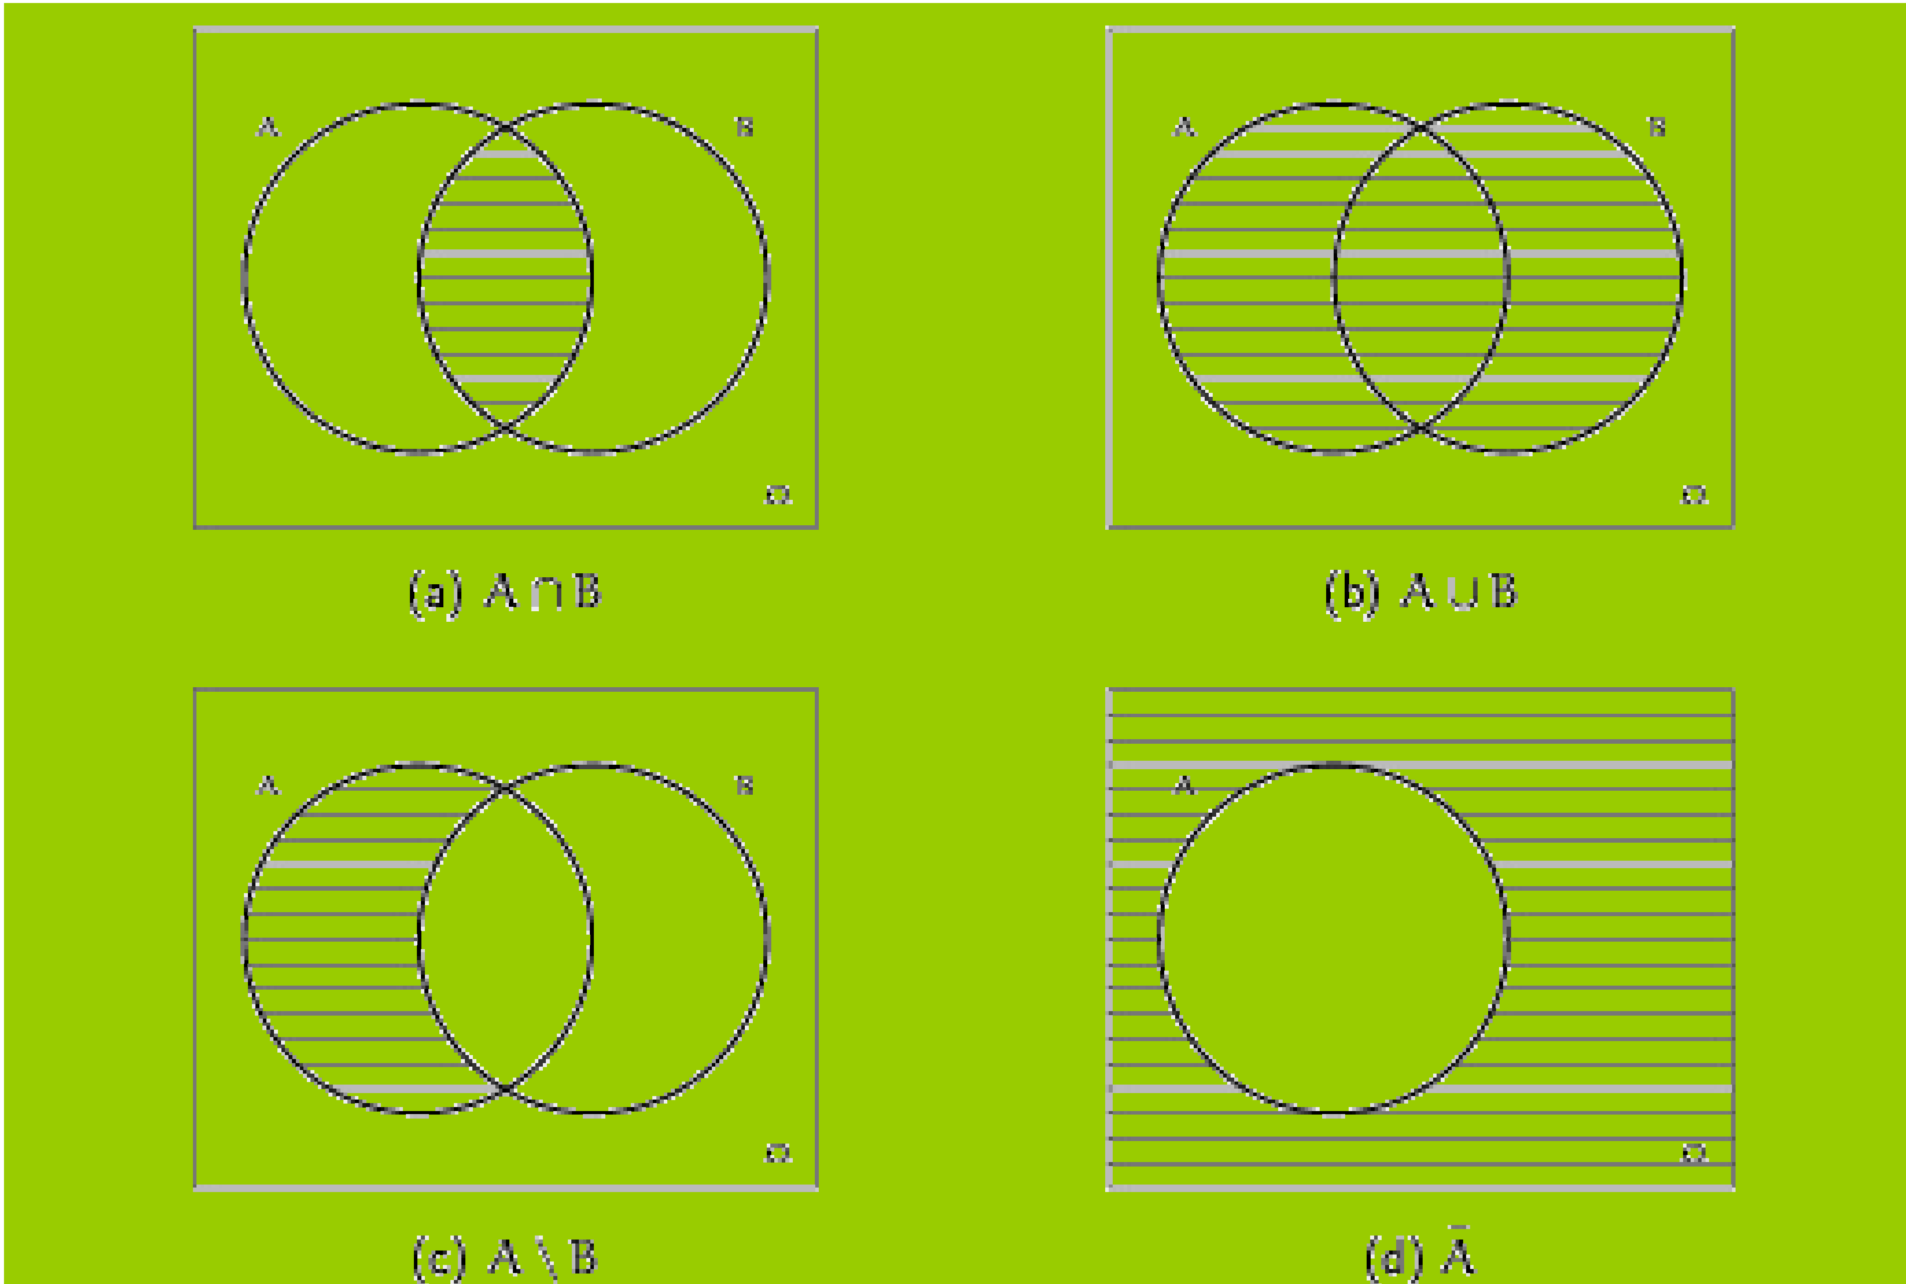
Lotfi A. Zadeh, 1965: Fuzzy Sets

Definition:

„A fuzzy set (class) *A* in *X* is characterized by a membership function (characteristic function) $m_A(x)$ which associates with each point in *X* a real number in the intervall [0,1], with the value of $m_A(x)$ at *x* representing the ‚grade of membership' of x in A."



Set Theory



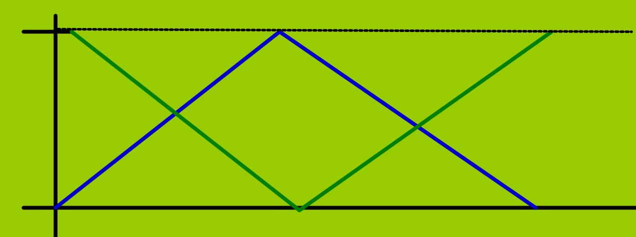
Lotfi A. Zadeh, 1965: Fuzzy Sets

A fuzzy set is *empty* iff: $m_A(x) = 0,$ *x* Î *X*.

Equal fuzzy sets, *A* = *B*, iff: $m_A(x) = m_B(x),$ *x* Î *X*.

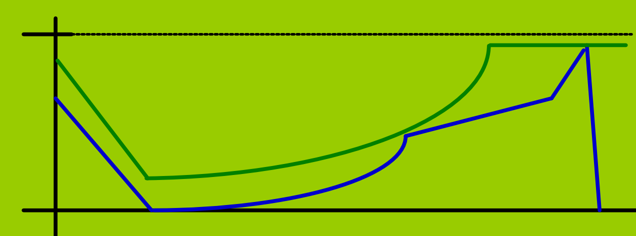
The *complement A'* of a *fuzzy set A* is defined by:

$m_{A'}(x) = 1 - m_{A'}(x)$ *x* Î *X*.



Containment: *A* Í *B* iff:

$m_A(x) \leq m_B(x), \quad x \in X.$

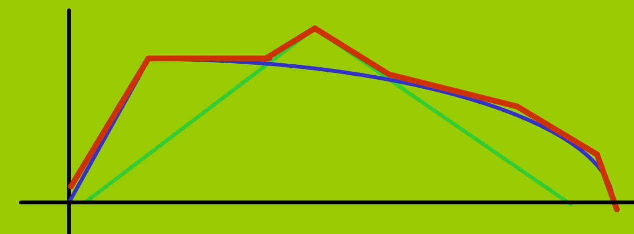


Lotfi A. Zadeh, 1965: Fuzzy Sets

Union A È *B* of two *fuzzy sets*

A and *B* with resp. membership functions

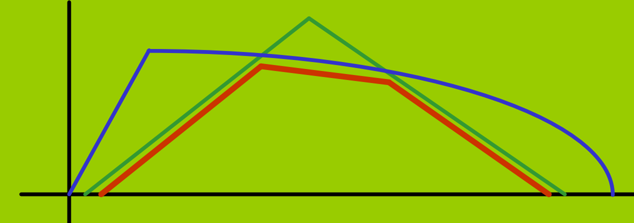
$m_{A È B}(x) = \max \{m_A(x), m_B(x)\}, x$ Î X



Intersection A Ç *B* of *fuzzy sets*

A and *B* with resp. membership functions

$m_{A Ç B}(x) = \min \{m_A(x), m_B(x)\}, x$ Î X



Lotfi A. Zadeh, 1965: Fuzzy Sets

"Specifically, let $f_i(x)$ $i = 1, ..., n$, denote the value of the membership function of A_i at x.

Associate with $f_i(x)$ a sieve $S_i(x)$ whose meshes are of size $f_i(x)$.

Then, $f_i(x)$ È $f_j(x)$ and $f_i(x)$ Ç $f_j(x)$ correspond, respectively,

to parallel and series combinations of $S_i(x)$ and $S_j(x)$. ... ."

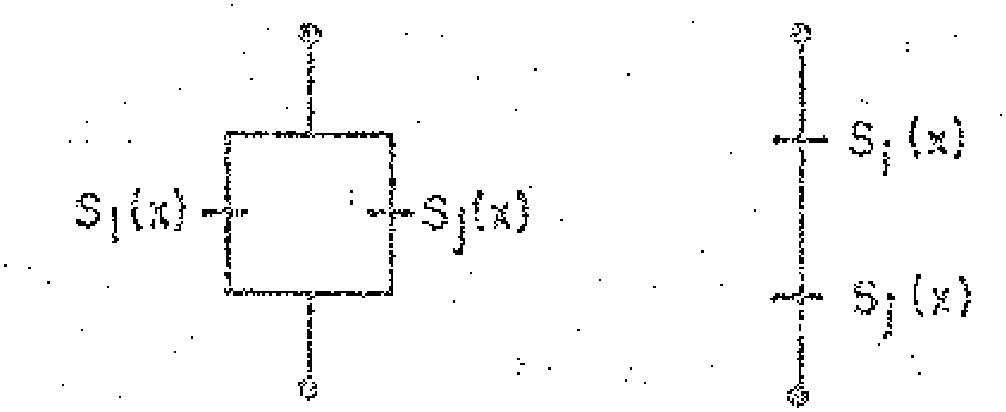


FIG. 2. Parallel and series connection of sieves simulating ⋃ and ⋂

Lotfi A. Zadeh, 1965: Fuzzy Sets

"More generally, a well formed expression involving $A_1, \ldots, A_n$, È and Ç corresponds to a network of sieves $S_1(x), \ldots, S_n(x)$ which can be found by the conventional synthesis techniques for switching circuits."

Statistics on the impact of fuzzy logic

A measure of the wide-ranging impact of Lotfi Zadeh's work on fuzzy logic is the number of papers in the literature which contain the word "fuzzy" in title. The data drawn from the INSPEC and Mathematical Reviews databases are summarized below. The data for 2000 are not complete.

STATISTICS

INSPEC/fuzzy
1970-1980 : 566
1980-1990 : 2,361
1990-2000 : 23,753
total : 26,680

Math.Sci.Net/fuzzy
1970-1980 : 453
1980-1990 : 2,476
1990-2000 : 8,428
total : 11,357

INSPEC/soft computing
1990-2000: 1,994

Number of citations in the Citation Index: over 11,000.

Richard Bellman, 1964

Man has two principal objectives in the scientific study of his environment:

He wants to understand and to control.

The two goals reinforce each other, since deeper understanding permits firmer control, and, on the other hand, systematic applications of scientific theories inevitably generates new problems which require further investigations, and so on.

Richard Bellman,
***Selected Papers on Mathematical Trends in Control Theory*, New York: Dover 1964.**

Assilian, Mamdani, *1974:* ***An Experiment in Linguistic Synthesis with a Fuzzy Logic Controller***

Fuzzy Control Variables

PE	Pressure Error
CPE	Change in pressure error
HC	Heat Change

Fuzzy Subsets

PB	Positive Big
PM	Positive Medium
PS	Positive Small
NO	Nil
NS	Negative Small
NM	Negative Medium
NB	Negative Big

Fuzzy-Regelung (fuzzy control)

Input variables:

- Pressure Error

(Difference between tatsächlichem und vorgegebenem Druck.)

- Change in Pressure Error

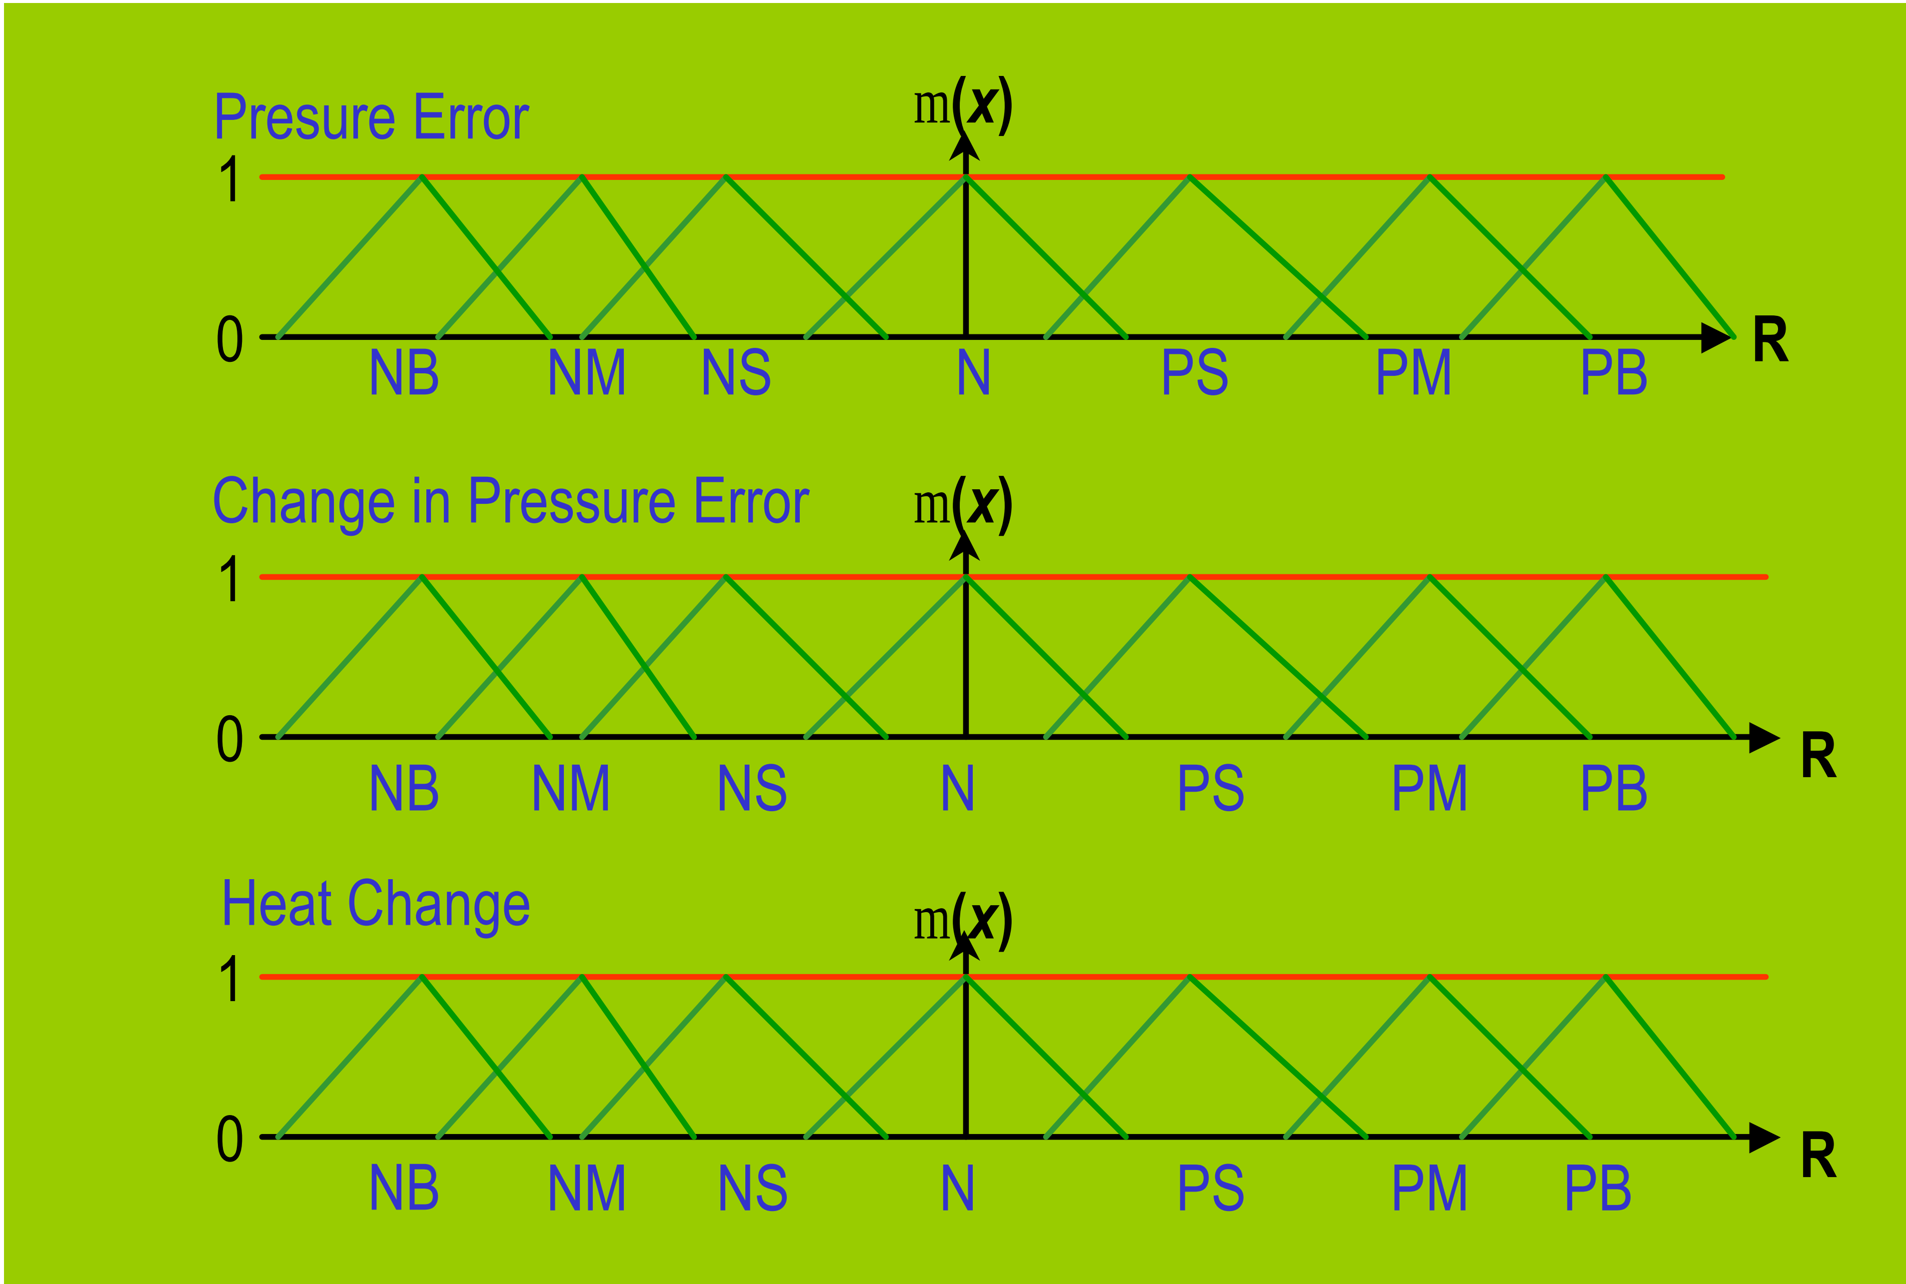
(Velocity of the movement oft the presureeschwindigkeit mit der sich der tatsächliche Druck

vom Sollwert entfernt bzw. nähert.)

Output variable:

- *Heat Change*

Fuzzy-Regelung (fuzzy control)



Fuzzy-Regelung (fuzzy control)

Regel 1:

WENN die *Druckabweichung* klein und positiv ist UND sich die *Druckabweichung* nicht viel ändert, DANN vermindere die *Wärmezufuhr* ein wenig.

WENN *PK* UND Null, DANN NK.

Regel 2:

WENN die *Druckabweichung* etwa Null ist UND sich die *Druckabweichung* nicht viel ändert, DANN verändere die *Wärmezufuhr* nicht.

WENN Null UND Null, DANN Null.

Regel 3:

WENN die *Druckabweichung* klein und positiv ist UND sich die *Druckabweichung* langsam vergrößert, DANN vermindere die *Wärmezufuhr* ein wenig.

WENN PK UND NK, DANN NK

Fuzzy-Regelung (fuzzy control)

Druckabweichung

Änderung in der Druckabweichung	Negativ, groß NG	Negativ, mittel NM	Negativ, klein NK	Null Null	Positiv, klein PK	Positiv, mittel PM	Positiv, groß PG
NG				PG			
NM				PM			
NK				PK	NK Regel 3		
Null				Null Regel 2	NK Regel 1	NM	NG
PK				NK			
PM				NM			
PG				NG
